ON INVOLUTIONS IN SYMMETRIC GROUPS AND A CONJECTURE OF LUSZTIG

JUN HU AND JING ZHANG

Abstract. Let (W,S) be a Coxeter system equipped with a fixed automorphism $*$ of order ≤ 2 which preserves S. Lusztig (and with Vogan in some special cases) have shown that the space spanned by set of "twisted" involutions (i.e., elements $w\in W$ with $w^*=w^{-1}$) was naturally endowed with a module structure of the Hecke algebra of (W,S) with two distinguished bases, which can be viewed as twisted analogues of the well-known standard basis and Kazhdan-Lusztig basis. The transition matrix between these bases defines a family of polynomials $P^{\sigma}_{y,w}$ which can be viewed as "twisted" analogues of the well-known Kazhdan-Lusztig polynomials of (W,S). Lusztig has conjectured that this module is isomorphic to the right ideal of the Hecke algebra (with Hecke parameter u^2) associated to (W,S) generated by the element $X_{\emptyset}:=\sum_{w^*=w}u^{-\ell(w)}T_w$. In this paper we prove this conjecture in the case when $*=\text{id}$ and $W=\mathfrak{S}_n$ (the symmetric group on n letters). Our methods are expected to be generalised to all the other finite crystallographic Coxeter groups.

1. Introduction

Let (W,S) be a fixed Coxeter system with length function $\ell: W\to\mathbb{N}$. If $w\in W$ then by definition

$$\ell(w):=\min\{k|w=s_{i_1}\dots s_{i_k}\text{ for some } s_{i_1},\dots,s_{i_k}\in S\}.$$

Let "$\leq$" be the Bruhat partial ordering on W. Let "$*$" be a fixed automorphism of W with order ≤ 2 and such that $s^*\in S$ for any $s\in S$.

1.1. **Definition.** We define

$$I_*:=\bigl\{w\in W\bigm| w^*=w^{-1}\bigr\}.$$

The elements of I_* will be called twisted involutions.

If $*=\text{id}_W$ (the identity automorphism on W), then the elements of I_* will be called involutions.

Let v be an indeterminate over $\mathbb{Z}$ and $u:=v^2$. Set $\mathcal{A}:=\mathbb{Z}[u,u^{-1}]$. Let $\mathcal{H}_u$ be the Iwahori-Hecke algebra associated to (W,S) with Hecke parameter u^2 and defined over $\mathcal{A}$. By definition, $\mathcal{H}_u$ is a free $\mathcal{A}$-module with basis $\{T_w\}_{w\in W}$. There is a unital $\mathcal{A}$-algebra structure on $\mathcal{H}_u$ with unit T_1 and such that

$$\begin{aligned}&T_wT_{w'}=T_{ww'}\quad\text{if } \ell(ww')=\ell(w)+\ell(w');\text{ and}\\&(T_s+1)(T_s-u^2)=0\quad\text{for all } s\in S.\end{aligned}$$

Let M be the free $\mathcal{A}$-module with basis $\{a_w|w\in I_*\}$. The following result was obtained by Lusztig and Vogan ([**8**]) in the special case where W is a Weyl group or an affine Weyl group, and by Lusztig ([**6**]) in the general case.

Key words and phrases. Involutions, reduced I_*-expressions, braid I_*-transformations.

1.2. **Theorem.** *([**8**], [**6**, Theorem 0.1]) There is a unique $\mathcal{H}_u$-module structure on M such that for any $s \in S$ and any $w \in I_*$ we have that*

$$T_s a_w = u a_w + (u+1) a_{sw} \quad \text{if } sw = ws^* > w;$$
$$T_s a_w = (u^2 - u - 1) a_w + (u^2 - u) a_{sw} \quad \text{if } sw = ws^* < w;$$
$$T_s a_w = a_{sws^*} \quad \text{if } sw \neq ws^* > w;$$
$$T_s a_w = (u^2 - 1) a_w + u^2 a_{sws^*} \quad \text{if } sw \neq ws^* < w.$$

Set $\underline{\mathcal{A}} := \mathbb{Z}[v, v^{-1}]$. Then $\mathcal{A}$ can be naturally regarded as a subring of $\underline{\mathcal{A}}$ because $u = v^2$. Let $\underline{\mathcal{H}} := \underline{\mathcal{A}} \otimes_{\mathcal{A}} \mathcal{H}_u$. Let $- : \underline{\mathcal{A}} \to \underline{\mathcal{A}}$ be the ring involution such that $\overline{v^n} = v^{-n}$ for $n \in \mathbb{Z}$. We denote by $- : \underline{\mathcal{H}} \to \underline{\mathcal{H}}$ the ring involution such that $\overline{v^n T_x} = v^{-n} T_{x^{-1}}^{-1}$ for any $x \in W, n \in \mathbb{N}$. Then "$-$" restricts to the unique ring involution of $\mathcal{H}_u$ such that $\overline{u^n T_x} = u^{-n} T_{x^{-1}}^{-1}$ for any $x \in W, n \in \mathbb{N}$ (cf. [**5**]).

In [**8**] and [**6**, Theorem 0.2], Lusztig and Vogan have shown that there exists a unique $\mathbb{Z}$-linear map $- : M \to M$ such that $\overline{hm} = \overline{h}\overline{m}$ for all $h \in \mathcal{H}_u$, $m \in M$ and $\overline{a_1} = a_1$. For any $m \in M$, $\overline{\overline{m}} = m$. Moreover, for any $w \in I_*$, $\overline{a_w} = (-1)^{\ell(w)} T_{w^{-1}}^{-1} a_{w^{-1}}$,

Set $\underline{M} := \underline{\mathcal{A}} \otimes_{\mathcal{A}} M$. The map "$- : M \to M$" can be naturally extended to a $\mathbb{Z}$-linear map $- : \underline{M} \to \underline{M}$ such that $\overline{v^n m} = v^{-n} \overline{m}$ for $m \in \underline{M}$, $n \in \mathbb{Z}$. For each $w \in I_*$, Lusztig and Vogan have proved further that there is a unique element

$$A_w = v^{-\ell(w)} \sum_{y \in I_*, y \leq w} P_{y,w}^{\sigma} a_y \in \underline{M},$$

where $P_{y,w}^{\sigma} \in \mathbb{Z}[u]$ such that $\overline{A_w} = A_w$, $P_{w,w}^{\sigma} = 1$ and for any $y \in I_*$, $y < w$, we have $\deg P_{y,w}^{\sigma} \leq (\ell(w) - \ell(y) - 1)/2$. Furthermore, the elements $\{A_w | w \in I_*\}$ form an $\underline{\mathcal{A}}$-basis of $\underline{M}$. The polynomials $P_{w,w}^{\sigma}$ can be viewed as a twisted analogue of the well-known Kazhdan-Lusztig polynomial $P_{y,w}$ of (W, S) ([**5**]), and the $\underline{\mathcal{A}}$-basis $\{A_w | w \in I_*\}$ can be viewed as a twisted analogue of the well-known Kazhdan-Lusztig basis C'_w ([**5**, 1.1.c]).

1.3. **Definition.** ([**7**]) Define

$$X_{\emptyset} := \sum_{x \in W, x^* = x} u^{-\ell(x)} T_x.$$

Let $\mathbb{Q}(u)$ be the field of rational functions on u. Set $\mathcal{H}^{\mathbb{Q}(u)} := \mathbb{Q}(u) \otimes_{\mathcal{A}} \mathcal{H}_u$. In [**7**, 3.4(a)], Lusztig proposed the following conjecture:

1.4. **Lusztig's Conjecture.** *([**7**, 3.4(a)]) With the notations as above, there is a unique isomorphism of $\mathcal{H}^{\mathbb{Q}(u)}$-modules $\eta : \mathbb{Q}(u) \otimes_{\mathcal{A}} M \cong \mathcal{H}^{\mathbb{Q}(u)} X_{\emptyset}$ such that $a_1 \mapsto X_{\emptyset}$.*

The purpose of this paper is to give a proof of this conjecture in the case when $* = \mathrm{id}_W$ and W is the symmetric group $\mathfrak{S}_n$ on n letters (i.e., the Weyl group of type A_{n-1}) for any $n \in \mathbb{N}$. Our methods are expected to be generalised to all the other finite crystallographic Coxeter groups. The case when $* = \mathrm{id}_W$ and W is the Weyl group of types D_n and B_n will be dealt with in forthcoming papers. As a byproduct of this paper, we show that any two reduced I_*-expressions for an involution in $\mathfrak{S}_n$ can be transformed into each other through a series of braid I_*-transformations, which can be viewed as a "twisted" analogue of a well-known classical fact of Matsumoto ([**10**]) which said that any two reduced expressions for an element in $\mathfrak{S}_n$ can be transformed into each other through a series of braid transformations.

The paper is organised as follows. In Section 2, we first recall some preliminary and known results (due to Hultman) on reduced I_*-expressions for twisted involutions, then we introduce a new notion of braid I_*-transformations and show in

Lemma 2.14 that any braid I_*-transformations on reduced I_*-sequence for a given involution in $\mathfrak{S}_n$ do not change the involution itself. We also give a number of technical lemmas which will be used in the next section. In Section 3, we prove in Theorem 3.1 that any two reduced I_*-expressions for an involution in $\mathfrak{S}_n$ can be transformed into each other through a series of braid I_*-transformations. This key result will play a central role in the proof of the main result Theorem 5.5. In Section 4, we use the Young seminormal bases theory for the semisimple Iwahori-Hecke algebra of type A_{n-1} to show that the dimension of $\mathcal{H}^{\mathbb{Q}(u)}X_\emptyset$ is bigger or equal than the number of involutions in W. The main result of this paper is given in Section 5, where we prove Lusztig's Conjecture 1.4 in the case when $* = \mathrm{id}_W$ and W is symmetric group $\mathfrak{S}_n$ for any $n \in \mathbb{N}$.

2. REDUCED I_*-EXPRESSIONS

In this section we shall give some preliminary and known results on reduced I_*-expressions for twisted inviolutions.

2.1. **Definition.** For any $w \in I_*$ and $s \in S$, we define

$$s \ltimes w := \begin{cases} sw & \text{if } sw = ws^*;\\ sws^* & \text{if } sw \neq ws^*. \end{cases}$$

For any $w \in I_*$ and $s_{i_1}, \cdots, s_{i_k} \in S$, we define

$$s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_k} \ltimes w := s_{i_1} \ltimes \big(s_{i_2} \ltimes \cdots \ltimes (s_{i_k} \ltimes w) \cdots \big).$$

2.2. **Lemma.** *For any $w \in I_*$ and $s \in S$, we have that*

$$s \ltimes (s \ltimes w) = w.$$

Proof. If $sw = ws^*$, then $s \ltimes w = sw$. In this case, $s(sw) = w = (sw)s^*$, so by definition,

$$s \ltimes (s \ltimes w) = s \ltimes (sw) = w.$$

If $sw \neq ws^*$, then $s \ltimes w = sws^*$. Now $s(sws^*) = ws^* \neq sw = (sws^*)s^*$, so by definition,

$$s \ltimes (s \ltimes w) = s \ltimes (sws^*) = s(sws^*)s^* = w.$$

This completes the proof of the lemma. □

2.3. *Remark.* In general, the operation $\ltimes : S \times I_* \to I_*$ does not extend to a group action of W on I_*. For example, let $W = \mathfrak{S}_4$ (the symmetric group on $\{1, 2, 3, 4\}$), $w = s_2 = (2, 3)$, then

$$s_1 \ltimes (s_2 \ltimes (s_1 \ltimes w)) = 1 \neq s_2 s_1 s_2 = s_2 \ltimes (s_1 \ltimes (s_2 \ltimes w)).$$

It is well-known that every element $w \in I_*$ is of the form $w = s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_k}$ for some $k \in \mathbb{N}$ and $s_{i_1}, \cdots, s_{i_k} \in S$.

As we shall see later in this paper, the main obstacle for the failure of a group action in the example given in Remark 2.3 is the fact that $s_1 \ltimes (s_2 \ltimes (s_1 \ltimes w))$ is not a reduced I_*-expression in the sense of the following definition.

2.4. **Definition.** ([**3**],[**4**]) Let $w \in I_*$. If $w = s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_k}$, where $k \in \mathbb{N}$, $s_{i_j} \in S$ for each j, then $(s_{i_1}, \cdots, s_{i_k})$ is called an I_*-expression for $w \in I_*$. Such an I_*-expression for $w \in I_*$ is reduced if its length k is minimal.

We regard the empty sequence () as a reduced I_*-expression for $w=1$. If follows by induction on $\ell(w)$ that every element of $w\in I_*$ has a reduced I_*-expression.

2.5. **Lemma.** *(*[**3**],[**4**]*) Let $w\in I_*$. Any reduced I_*-expression for w has a common length. Let $\rho: I_*\rightarrow\mathbb{N}$ be the map which assign $w\in I_*$ to this common length. Then $(I_*,\leq)$ is a graded poset with rank function ρ. Moreover, if $s\in S$ then $\rho(s\ltimes w)=\rho(w)\pm 1$, and $\rho(s\ltimes w)=\rho(w)-1$ if and only if $\ell(sw)=\ell(w)-1$.*

2.6. **Corollary.** *Let $w\in I_*$ and $s\in S$. Suppose that $sw\neq ws^*$. Then $\ell(sw)=\ell(w)+1$ if and only if $\ell(ws^*)=\ell(w)+1$, and if and only if $\ell(s\ltimes w)=\ell(w)+2$. The same is true if we replace "+" by "−".*

Proof. This follows from Lemma 2.5. □

2.7. **Corollary.** *Let $w\in I_*$ and $s\in S$. Suppose that $\rho(w)=k$. If $sw<w$ then w has a reduced I_*-expression which is of the form $s\ltimes s_{j_1}\ltimes\cdots\ltimes s_{j_{k-1}}$.*

Proof. This follows from Lemma 2.5 and the fact (Lemma 2.2) that $w=s\ltimes(s\ltimes w)$. □

2.8. **Definition.** Let $w\in I_*$ and $s_{i_1},\cdots,s_{i_k}\in S$. If

$$\rho(s_{i_1}\ltimes s_{i_2}\ltimes\cdots\ltimes s_{i_k}\ltimes w)=\rho(w)+k,$$

then we shall call the sequence $(s_{i_1},\cdots,s_{i_k},w)$ reduced, or $(s_{i_1},\cdots,s_{i_k},w)$ a reduced sequence.

In particular, any reduced I_*-expression for $w\in I_*$ is automatically a reduced sequence. In the sequel, by some abuse of notations, we shall also call $(i_1,\cdots,i_k)$ a reduced sequence whenever $(s_{i_1},\cdots,s_{i_k})$ is a reduced sequence in the sense of Definition 2.8.

2.9. *Remark.* Let $s_{i_1},\cdots,s_{i_k}\in S$ and $1\leq a\leq k$. We shall use the expression

$$s_{i_1}\ltimes\cdots\ltimes s_{i_{a-1}}\ltimes s_{i_{a+1}}\ltimes\cdots\ltimes s_{i_k}\tag{2.10}$$

to denote the element obtained from omitting "$s_{i_a}\ltimes$" in the expression $s_{i_1}\ltimes\cdots\ltimes s_{i_k}$. In particular, if $a=1$ then (2.10) denotes the element $s_{i_2}\ltimes\cdots\ltimes s_{i_k}$; while if $a=k$ then (2.10) denotes the element $s_{i_1}\ltimes\cdots\ltimes s_{i_{k-1}}$. This convention will be adopted throughout this paper.

2.11. **Proposition.** *(Exchange Property,* [**4**, Prop. 3.10]*) Suppose $(s_{i_1},\cdots,s_{i_k})$ is a reduced I_*-expression for $w\in I_*$ and that $\rho(s\ltimes s_{i_1}\ltimes s_{i_2}\ltimes\cdots\ltimes s_{i_k})<k$ for some $s\in S$. Then*

$$s\ltimes s_{i_1}\ltimes s_{i_2}\ltimes\cdots\ltimes s_{i_k}=s_{i_1}\ltimes s_{i_2}\ltimes\cdots\ltimes s_{i_{a-1}}\ltimes s_{i_{a+1}}\ltimes\cdots\ltimes s_{i_k}$$

for some $a\in\{1,2,\cdots,k\}$.

From now on and until the end of this paper, we assume that $W=\mathfrak{S}_n$, the symmetric group on n letters, where $n\in\mathbb{N}$. Moreover, we assume that "$*=\mathrm{id}$" is the identity map on $\mathfrak{S}_n$. In particular,

$$I_*=\{w\in\mathfrak{S}_n|w^2=1\}$$

is the set of involutions in $\mathfrak{S}_n$. For each $1\leq i<n$, we define

$$s_i:=(i,i+1).$$

In this case, if $w=1$ (the identity element of $\mathfrak{S}_n$), then by definition for any $s\in S$,

$$s\ltimes w=s\ltimes 1=s.$$

2.12. **Definition.** Let $w \in I_*$. By a braid I_*-transformation, we mean one of the following transformations:

$$\begin{aligned}
&(s_{i_1}, \cdots, s_{i_a}, s_j, s_{j+1}, s_j, s_{l_1}, \cdots, s_{l_t}, w) \longmapsto \\
&\qquad\qquad (s_{i_1}, \cdots, s_{i_a}, s_{j+1}, s_j, s_{j+1}, s_{l_1}, \cdots, s_{l_t}, w), \\
&(s_{i_1}, \cdots, s_{i_a}, s_{j+1}, s_j, s_{j+1}, s_{l_1}, \cdots, s_{l_t}, w) \longmapsto \\
&\qquad\qquad (s_{i_1}, \cdots, s_{i_a}, s_j, s_{j+1}, s_j, s_{l_1}, \cdots, s_{l_t}, w), \\
&(s_{i_1}, s_{i_2}, \cdots, s_{i_a}, s_b, s_c, s_{l_1}, \cdots, s_{l_t}, w') \longmapsto \\
&\qquad\qquad (s_{i_1}, s_{i_2}, \cdots, s_{i_a}, s_c, s_b, s_{l_1}, \cdots, s_{l_t}, w'), \\
&(s_{i_1}, s_{i_2}, \cdots, s_{i_a}, s_k, s_{k+1}) \longmapsto (s_{i_1}, s_{i_2}, \cdots, s_{i_a}, s_{k+1}, s_k), \\
&(s_{i_1}, s_{i_2}, \cdots, s_{i_a}, s_{k+1}, s_k) \longmapsto (s_{i_1}, s_{i_2}, \cdots, s_{i_a}, s_k, s_{k+1}),
\end{aligned}$$

where $w, w' \in I_*$, $1 \leq i_1, \cdots, i_a, l_1, \cdots, l_t, b, c < n$, $1 \leq j, k < n-1$, $|b-c| > 1$, and the sequences appeared above are all reduced sequences.[1]

Let $w \in I_*$ and $s_{i_1}, \cdots, s_{i_k} \in S$. By definition, it is clear that $(s_{i_1}, \cdots, s_{i_k}, w)$ is a reduced sequence if and only if $(s_{i_1}, \cdots, s_{i_k}, s_{j_1}, \cdots, s_{j_t})$ is a reduced sequence for some (and any) reduced I_*-expression $(s_{j_1}, \cdots, s_{j_t})$ of w.

2.13. **Definition.** Let $(s_{i_1}, \cdots, s_{i_k}, w), (s_{j_1}, \cdots, s_{j_l}, u)$ be two reduced I_*-sequences, where $w, u \in I_*$. We shall write $(s_{i_1}, \cdots, s_{i_k}, w) \longleftrightarrow (s_{j_1}, \cdots, s_{j_l}, u)$ whenever there exists a series braid I_*-transformations which transform

$$(s_{i_1}, \cdots, s_{i_k}, s_{l_1}, \cdots, s_{l_b})$$

into $(s_{j_1}, \cdots, s_{j_l}, s_{p_1}, \cdots, \cdots, s_{p_c})$, where $(s_{l_1}, \cdots, s_{l_b})$ and $(s_{p_1}, \cdots, s_{p_c})$ are some reduced I_*-expressions of w and u respectively. Moreover, we shall also write

$$(i_1, \cdots, i_k) \longleftrightarrow (j_1, \cdots, j_k)$$

whenever $(s_{i_1}, \cdots, s_{i_k}) \longleftrightarrow (s_{j_1}, \cdots, s_{j_k})$.

2.14. **Lemma.** *Let $w \in I_*$. Let $(s_{i_1}, \cdots, s_{i_k}, w)$ be a reduced sequence.*

1) If $|i_{k-1} - i_k| > 1$, then $(s_{i_1}, \cdots, s_{i_{k-2}}, s_{i_k}, s_{i_{k-1}}, w)$ is a reduced sequence too, and

$$s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w = s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{k-2}} \ltimes s_{i_k} \ltimes s_{i_{k-1}} \ltimes w.$$

2) If $i_{k-2} = i_k = i_{k-1} \pm 1$, then $(s_{i_1}, s_{i_2}, \cdots, s_{i_{k-3}}, s_{i_{k-1}}, s_{i_k}, s_{i_{k-1}}, w)$ is a reduced sequence too, and

$$\begin{aligned}
& s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{k-3}} \ltimes s_{i_{k-2}} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w \\
&\quad = s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{k-3}} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes s_{i_{k-1}} \ltimes w.
\end{aligned}$$

3) If $w = s_{i_k \pm 1}$, then $(s_{i_1}, s_{i_2}, \cdots, s_{i_{k-1}}, w, s_{i_k})$ is a reduced sequence too, and

$$s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w = s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{k-1}} \ltimes w \ltimes s_{i_k}.$$

Proof. 1) This follows from the fact that $s_{i_{k-1}} s_{i_k} = s_{i_k} s_{i_{k-1}}$ and some direct case by case check, see also[**12**, Lemma 3.24].

2) It suffices to show that

$$s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w = s_{i_{k-1}} \ltimes s_{i_k} \ltimes s_{i_{k-1}} \ltimes w.$$

There are eight possibilities:

Case 1. $s_{i_k} w \neq w s_{i_k}$, $s_{i_{k-1}} s_{i_k} w s_{i_k} \neq s_{i_k} w s_{i_k} s_{i_{k-1}}$ and $s_{i_k} s_{i_{k-1}} s_{i_k} w s_{i_k} s_{i_{k-1}} \neq s_{i_{k-1}} s_{i_k} w s_{i_k} s_{i_{k-1}} s_{i_k}$. In this case, we have that

$$s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w = s_{i_k} s_{i_{k-1}} s_{i_k} w s_{i_k} s_{i_{k-1}} s_{i_k} = s_{i_{k-1}} s_{i_k} s_{i_{k-1}} w s_{i_{k-1}} s_{i_k} s_{i_{k-1}}.$$

---

[1] Note that our assumption that these sequences are all reduced implies that $w \neq 1$ whenever $t = 0$.

Since $(s_{i_k}, s_{i_{k-1}}, s_{i_k}, w)$ is a reduced sequence, it is clear (by Lemma 2.5) that

$$\ell(s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}s_{i_{k-1}}) = \ell(w) + 6.$$

So $s_{i_{k-1}}w \neq ws_{i_{k-1}}$, $s_{i_k}s_{i_{k-1}}ws_{i_{k-1}} \neq s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}$ and $s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k} \neq s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}s_{i_{k-1}}$. By definition, we get that

$$s_{i_{k-1}} \ltimes s_{i_k} \ltimes s_{i_{k-1}} \ltimes w = s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}s_{i_{k-1}} = s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w.$$

Case 2. $s_{i_k}w \neq ws_{i_k}$, $s_{i_{k-1}}s_{i_k}ws_{i_k} \neq s_{i_k}ws_{i_k}s_{i_{k-1}}$ and $s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_{k-1}} = s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_{k-1}}s_{i_k}$. In this case, we have that

$$s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w = s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_{k-1}} = s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_k}s_{i_{k-1}}.$$

Since

$$\begin{aligned} s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_k}s_{i_{k-1}} &= s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_{k-1}} = s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_{k-1}}s_{i_k} \\ &= s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}s_{i_k}s_{i_{k-1}}, \end{aligned}$$

it follows that $s_{i_{k-1}}w = ws_{i_{k-1}}$. Moreover, since $(s_{i_k}, s_{i_{k-1}}, s_{i_k}, w)$ is a reduced sequence, it follows from Lemma 2.5 that

$$\ell(s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_k}s_{i_{k-1}}) = \ell(w) + 5.$$

In particular, $s_{i_k}s_{i_{k-1}}w \neq s_{i_{k-1}}ws_{i_k}$ and $s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_k} \neq s_{i_k}s_{i_{k-1}}ws_{i_k}s_{i_{k-1}}$. As a consequence, we get (by definition) that

$$s_{i_{k-1}} \ltimes s_{i_k} \ltimes s_{i_{k-1}} \ltimes w = s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_k}s_{i_{k-1}} = s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w.$$

Case 3. $s_{i_k}w = ws_{i_k}$, $s_{i_{k-1}}s_{i_k}w \neq s_{i_k}ws_{i_{k-1}}$ and

$$s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_{k-1}} \neq s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}s_{i_k}.$$

In this case, we have that

$$s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w = s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}s_{i_k} = s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}.$$

Since $(s_{i_k}, s_{i_{k-1}}, s_{i_k}, w)$ is a reduced sequence, it follows from Lemma 2.5 that

$$\ell(s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}) = \ell(w) + 5.$$

In particular, $s_{i_{k-1}}w \neq ws_{i_{k-1}}$ and $s_{i_k}s_{i_{k-1}}ws_{i_{k-1}} \neq s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}$. Note that

$$\begin{aligned} s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k} &= s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}s_{i_k} = s_{i_k}s_{i_{k-1}}ws_{i_k}s_{i_{k-1}}s_{i_k} \\ &= s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}s_{i_{k-1}}. \end{aligned}$$

By definition, we get that

$$s_{i_{k-1}} \ltimes s_{i_k} \ltimes s_{i_{k-1}} \ltimes w = s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k} = s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w.$$

Case 4. $s_{i_k}w \neq ws_{i_k}$, $s_{i_{k-1}}s_{i_k}ws_{i_k} = s_{i_k}ws_{i_k}s_{i_{k-1}}$ and

$$s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k} \neq s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_k}.$$

In this case, we have that

$$s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w = s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_k} = s_{i_k}s_{i_{k-1}}s_{i_k}w.$$

Since $(s_{i_k}, s_{i_{k-1}}, s_{i_k}, w)$ is a reduced sequence, it follows from Lemma 2.5 that

$$\ell(s_{i_k}s_{i_{k-1}}s_{i_k}w) = \ell(s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w) = \ell(w) + 5,$$

which is impossible. Therefore, this case can not happen.

Case 5. $s_{i_k}w \neq ws_{i_k}$, $s_{i_{k-1}}s_{i_k}ws_{i_k} = s_{i_k}ws_{i_k}s_{i_{k-1}}$ and

$$s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k} = s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_k}.$$

In this case, we have that

$$s_{i_k} \ltimes s_{i_{k-1}} \ltimes s_{i_k} \ltimes w = s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k} = s_{i_k}s_{i_{k-1}}ws_{i_k}s_{i_k} = s_{i_k}s_{i_{k-1}}w.$$

Since $(s_{i_k}, s_{i_{k-1}}, s_{i_k}, w)$ is a reduced sequence, it follows from Lemma 2.5 that

$$\ell(s_{i_k}s_{i_{k-1}}w)=\ell(s_{i_k}\ltimes s_{i_{k-1}}\ltimes s_{i_k}\ltimes w)=\ell(w)+4,$$

which is impossible. Therefore, this case can not happen too.

Case 6. $s_{i_k}w=ws_{i_k}$, $s_{i_{k-1}}s_{i_k}w\neq s_{i_k}ws_{i_{k-1}}$ and

$$s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}=s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}s_{i_k}.$$

In this case, we have that

$$s_{i_k}\ltimes s_{i_{k-1}}\ltimes s_{i_k}\ltimes w=s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}.$$

Since

$$\begin{aligned}s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}&=s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}=s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}s_{i_k}\\&=s_{i_{k-1}}ws_{i_k}s_{i_{k-1}}s_{i_k}=s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}s_{i_{k-1}},\end{aligned}$$

it follows that $s_{i_k}s_{i_{k-1}}w=ws_{i_{k-1}}s_{i_k}$. As a consequence,

$$s_{i_k}s_{i_{k-1}}s_{i_k}w=s_{i_k}s_{i_{k-1}}ws_{i_k}=ws_{i_{k-1}},$$

and hence

$$s_{i_k}\ltimes s_{i_{k-1}}\ltimes s_{i_k}\ltimes w=s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}=w.$$

However, since $(s_{i_k}, s_{i_{k-1}}, s_{i_k}, w)$ is a reduced sequence,

$$\ell(s_{i_k}\ltimes s_{i_{k-1}}\ltimes s_{i_k}\ltimes w)=\ell(w)+4.$$

We get a contradiction. Therefore, this case can not happen too.

Case 7. $s_{i_k}w=ws_{i_k}$, $s_{i_{k-1}}s_{i_k}w=s_{i_k}ws_{i_{k-1}}$ and

$$s_{i_k}s_{i_{k-1}}s_{i_k}w\neq s_{i_{k-1}}s_{i_k}ws_{i_k}.$$

In this case, we have that

$$s_{i_k}\ltimes s_{i_{k-1}}\ltimes s_{i_k}\ltimes w=s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k}=s_{i_k}s_{i_{k-1}}ws_{i_k}s_{i_k}=s_{i_k}s_{i_{k-1}}w.$$

Since $(s_{i_k}, s_{i_{k-1}}, s_{i_k}, w)$ is a reduced sequence, it follows from Lemma 2.5 that

$$\ell(s_{i_k}s_{i_{k-1}}w)=\ell(s_{i_k}\ltimes s_{i_{k-1}}\ltimes s_{i_k}\ltimes w)=\ell(w)+4,$$

which is impossible. Therefore, this case can not happen too.

Case 8. $s_{i_k}w=ws_{i_k}$, $s_{i_{k-1}}s_{i_k}w=s_{i_k}ws_{i_{k-1}}$ and

$$s_{i_k}s_{i_{k-1}}s_{i_k}w=s_{i_{k-1}}s_{i_k}ws_{i_k}.$$

In this case, we have that

$$s_{i_k}\ltimes s_{i_{k-1}}\ltimes s_{i_k}\ltimes w=s_{i_k}s_{i_{k-1}}s_{i_k}w=s_{i_{k-1}}s_{i_k}ws_{i_k}=s_{i_{k-1}}ws_{i_k}s_{i_k}=s_{i_{k-1}}w.$$

Since $(s_{i_k}, s_{i_{k-1}}, s_{i_k}, w)$ is a reduced sequence, it follows from Lemma 2.5 that

$$\ell(s_{i_{k-1}}w)=\ell(s_{i_k}\ltimes s_{i_{k-1}}\ltimes s_{i_k}\ltimes w)=\ell(w)+3,$$

which is impossible. Therefore, this case can not happen too.

This completes the proof of the statement 2) of the lemma.

3) It suffices to show that $s_{i_k}\ltimes s_{i_k\pm1}=s_{i_k\pm1}\ltimes s_{i_k}$. By definition,

$$s_{i_k\pm1}\ltimes s_{i_k}=s_{i_k\pm1}s_{i_k}s_{i_k\pm1}=s_{i_k}s_{i_k\pm1}s_{i_k}=s_{i_k}\ltimes s_{i_k\pm1},$$

as required. □

One of the important consequence of the above lemma is the following result, which will play important role in the proof of the main result of this paper.

2.15. **Corollary.** *Let $w\in I_*$. Let $(s_{i_1},\cdots,s_{i_k},w)$ be a reduced sequence. Suppose that $i_{k-2}=i_k=i_{k-1}\pm1$, then either*

a) *we have that* $s_{i_k}w \neq ws_{i_k}$, $s_{i_{k-1}}s_{i_k}ws_{i_k} \neq s_{i_k}ws_{i_k}s_{i_{k-1}}$,

$$s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_{k-1}} \neq s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_{k-1}}s_{i_k},$$

and $s_{i_{k-1}}w \neq ws_{i_{k-1}}$, $s_{i_k}s_{i_{k-1}}ws_{i_{k-1}} \neq s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}$,

$$s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k} \neq s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}s_{i_{k-1}};$$

or

b) *we have that* $s_{i_k}w \neq ws_{i_k}$, $s_{i_{k-1}}s_{i_k}ws_{i_k} \neq s_{i_k}ws_{i_k}s_{i_{k-1}}$,

$$s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_{k-1}} = s_{i_{k-1}}s_{i_k}ws_{i_k}s_{i_{k-1}}s_{i_k},$$

and $s_{i_{k-1}}w = ws_{i_{k-1}}$, $s_{i_k}s_{i_{k-1}}w \neq s_{i_{k-1}}ws_{i_k}$,

$$s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_k} \neq s_{i_k}s_{i_{k-1}}ws_{i_k}s_{i_{k-1}};$$

or

c) *we have that* $s_{i_k}w = ws_{i_k}$, $s_{i_{k-1}}s_{i_k}w \neq s_{i_k}ws_{i_{k-1}}$,

$$s_{i_k}s_{i_{k-1}}s_{i_k}ws_{i_{k-1}} \neq s_{i_{k-1}}s_{i_k}ws_{i_{k-1}}s_{i_k},$$

and $s_{i_{k-1}}w \neq ws_{i_{k-1}}$, $s_{i_k}s_{i_{k-1}}ws_{i_{k-1}} \neq s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}$,

$$s_{i_{k-1}}s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k} = s_{i_k}s_{i_{k-1}}ws_{i_{k-1}}s_{i_k}s_{i_{k-1}}.$$

Proof. This follows from the proof of Lemma 2.14. □

2.16. **Corollary.** *Let* $w \in I_*$. *Let* (s_a, s_b, w) *be a reduced sequence. Suppose that* $|a-b| > 1$, *then either*

a) $s_aw \neq ws_a$, $s_bs_aws_a \neq s_aws_as_b$ *and* $s_bw \neq ws_b, s_as_bws_b \neq s_bws_bs_a$; *or*
b) $s_aw = ws_a$, $s_bs_aw \neq s_aws_b$ *and* $s_bw \neq ws_b, s_as_bws_b = s_bws_bs_a$; *or*
c) $s_aw \neq ws_a$, $s_bs_aws_a = s_aws_as_b$ *and* $s_bw = ws_b, s_as_bw \neq s_bws_a$; *or*
d) $s_aw = ws_a$, $s_bs_aw = s_aws_b$ *and* $s_bw = ws_b, s_as_bw = s_bws_a$.

Proof. We only prove a) as the others can be proved in a similar manner and are left to the readers.

Suppose that $s_aw \neq ws_a$, $s_bs_aws_a \neq s_aws_as_b$. We first show that $s_bw \neq ws_b$. In fact, if $s_bw = ws_b$ then (because $|a-b| > 1$ implies that $s_as_b = s_bs_a$)

$$s_bs_aws_a = s_as_bws_a = s_aws_bs_a = s_aws_as_b,$$

which is a contradiction. This proves that $s_bw \neq ws_b$. Similarly, if $s_as_bws_b = s_bws_bs_a$, then we shall have that $s_bs_aws_b = s_as_bws_b = s_bws_bs_a = s_bws_as_b$ which implies that $s_aw = ws_a$. We get a contradiction again. This proves that $s_as_bws_b \neq s_bws_bs_a$. □

In the rest of this section, we shall present some technical lemmas which will be used in the next section.

2.17. **Lemma.** *Let* $1 \leq i < n$ *and* $w \in \mathfrak{S}_n$. *Suppose that* $s_is_{i+1}s_iw < s_{i+1}s_iw$. *Then* $s_{i+1}w < w$.

Proof. By assumption,

$$w^{-1}(i+1) = (w^{-1}s_is_{i+1})(i) > (w^{-1}s_is_{i+1})(i+1) = w^{-1}(i+2).$$

It follows that $s_{i+1}w < w$. □

2.18. **Lemma.** *Let* $w_2 \in I_*$. *Suppose that* $\ell(s_{c+1}s_cw_2s_cs_{c+1}) = \ell(w_2) + 4$, $s_cw_2 \neq w_2s_c$, $s_{c+1}s_cw_2s_c \neq s_cw_2s_cs_{c+1}$ *and* $s_{c+1}w_2s_cs_{c+1} < w_2s_cs_{c+1}$. *Then* $s_{c+1}w_2 < w_2$ *and either* $s_{c+1}w_2 = w_2s_{c+1}$ *or* $s_{c+1}w_2s_{c+1} < s_{c+1}w_2$.

Proof. By assumption,

$$\ell(s_{c+1}w_2s_cs_{c+1}) = \ell(w_2s_cs_{c+1}) - 1 = \ell(w_2) + 1. \tag{2.19}$$

Suppose that $s_{c+1}w_2 > w_2$. Then $\ell(s_{c+1}w_2) = \ell(w_2) + 1$ and (2.19) imply that there are only the following two possibilities:

Case 1. $s_{c+1}w_2 < s_{c+1}w_2s_c > s_{c+1}w_2s_cs_{c+1}$. In this case, we have that

$$s_{c+1}w_2(c+1) > s_{c+1}w_2(c) = s_{c+1}w_2s_c(c+1) > s_{c+1}w_2s_c(c+2) = s_{c+1}w_2(c+2).$$

Now $w_2s_c > w_2 < s_{c+1}w_2$ and $w_2 = w_2^{-1}$ imply that $w_2(c) < w_2(c+1) < w_2(c+2)$. It follows that

$$c+1 = w_2(c) < w_2(c+1) < w_2(c+2) = c+2,$$

which is impossible.

Case 2. $s_{c+1}w_2 > s_{c+1}w_2s_c < s_{c+1}w_2s_cs_{c+1}$. In this case, we have that

$$s_{c+1}w_2(c+1) < s_{c+1}w_2(c) = s_{c+1}w_2s_c(c+1) < s_{c+1}w_2s_c(c+2) = s_{c+1}w_2(c+2).$$

Now $w_2s_c > w_2 < s_{c+1}w_2$ and $w_2 = w_2^{-1}$ imply that $w_2(c) < w_2(c+1) < w_2(c+2)$. It follows that

$$w_2(c) = c+1,\ w_2(c+1) = c+2 < w_2(c+2).$$

Combining the above inequality with the assumption that $s_{c+1}w_2s_cs_{c+1} < w_2s_cs_{c+1}$ and $w_2 = w_2^{-1}$, we can deduce that

$$c+1 = s_{c+1}s_cw_2(c+1) > s_{c+1}s_cw_2(c+2) = w_2(c+2),$$

which is again a contradiction. This proves the inequality $s_{c+1}w_2 < w_2$. The remaining part of the lemma follows from Corollary 2.6 at once. □

2.20. **Lemma.** *Let $w_2 \in I_*$. Suppose that $\ell(s_{c+1}s_cw_2s_c) = \ell(w_2)+3$, $s_cw_2 \neq w_2s_c$, $s_{c+1}s_cw_2s_c = s_cw_2s_cs_{c+1}$ and $s_{c+1}w_2s_c < w_2s_c$, then $s_{c+1}w_2 < w_2$.*

Proof. Suppose that $s_{c+1}w_2 > w_2$. Then $s_{c+1}w_2 > s_{c+1}w_2s_c < w_2s_c$. It follows that

$$s_{c+1}w_2(c+1) < s_{c+1}w_2(c).$$

Now $w_2s_c > w_2 < s_{c+1}w_2$ and $w_2 = w_2^{-1}$ imply that $w_2(c) < w_2(c+1) < w_2(c+2)$. It follows that

$$w_2(c) = c+1,\ w_2(c+1) = c+2,\ w_2(c+2) > c+2.$$

Combining this with our assumption that $s_{c+1}w_2s_c < w_2s_c$ and $w_2 = w_2^{-1}$, we can deduce that

$$c+2 = s_cw_2(c+1) > s_cw_2(c+2) = w_2(c+2),$$

which is a contradiction. So we must have that $s_{c+1}w_2 < w_2$. This completes the proof of the lemma. □

2.21. **Lemma.** *Let $w \in \mathfrak{S}_n$ and $b \in \{1, 2, \cdots, n\}$. Suppose that $w(t) < w(t+1)$, $\forall\, t < b$. If $w(b) \leq b$, then $w(i) = i$, for $1 \leq i \leq b$.*

Proof. By assumption, $1 \leq w(1) < w(2) < w(3) < \cdots < w(b) \leq b$. It follows at once that $w(i) = i$, for any $1 \leq i \leq b$. □

2.22. **Lemma.** *Let $w \in \mathfrak{S}_n$ and $b \in \{1, 2, \cdots, n\}$. Suppose that $w(t) < w(t+1)$, $\forall\, t \geq b$. If $w(b) \geq b$, then $w(j) = j$, for $b \leq j \leq n$.*

Proof. By assumption, $b \leq w(b) < w(b+1) < w(b+2) < \cdots < w(n) \leq n$. It follows at once that $w(j) = j$, for any $b \leq j \leq n$. □

3. Reduced I_*-expression and braid I_*-transformation

A well-known classical fact of Matsumoto ([**10**]) says that any two reduced expressions for an element in $\mathfrak{S}_n$ can be transformed into each other through a series of braid transformations. In Lemma 2.14 we have shown that any braid I_*-transformations on reduced I_*-expression for a given $w \in I_*$ do not change the element w itself. The following theorem says something more than this.

3.1. **Theorem.** *Let $w \in I_*$. Then any two reduced I_*-expressions for w can be transformed into each other through a series of braid I_*-transformations.*

Proof. We prove the theorem by induction on $\rho(w)$. Suppose that the theorem holds for any $w \in I_*$ with $\rho(w) \leq k$. Let $w \in I_*$ with $\rho(w) = k+1$. Let $(s_c, s_{i_1}, s_{i_2}, \cdots, s_{i_k})$ and $(s_b, s_{j_1}, s_{j_2}, \cdots, s_{j_k})$ be two reduced I_*-expressions for $w \in I_*$. We need to prove that

$$(c, i_1, \cdots, i_k) \longleftrightarrow (b, j_1, \cdots, j_k). \tag{3.2}$$

If $b = c$ then by induction hypothesis $(i_1, \cdots, i_k) \longleftrightarrow (j_1, \cdots, j_k)$ and hence (3.2) follows. Henceforth we assume that $b \neq c$.

By Lemma 2.2, $\rho(s_b \ltimes w) = \rho(s_{j_1} \ltimes s_{j_2} \ltimes \cdots \ltimes s_{j_k}) = k < k+1$. It follows from Lemma 2.5 that $\ell(s_b w) = \ell(w) - 1$. Equivalently,

$$\ell(s_b(s_c \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_k})) = \ell(s_c \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_k}) - 1.$$

Applying Lemma 2.5 again, we can deduce that

$$\rho(s_b \ltimes (s_c \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_k})) = k.$$

We set $i_0 := c$. Applying Proposition 2.11, we get that

$$s_b \ltimes (s_{i_0} \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_k}) = s_{i_0} \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{a-1}} \ltimes s_{i_{a+1}} \ltimes \cdots \ltimes s_{i_k}$$

for some $0 \leq a \leq k$. In particular, $s_{i_0} \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{a-1}} \ltimes s_{i_{a+1}} \ltimes \cdots \ltimes s_{i_k} = s_{j_1} \ltimes \cdots \ltimes s_{j_k}$.

Since

$$s_b \ltimes s_{i_0} \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{a-1}} \ltimes s_{i_{a+1}} \ltimes \cdots \ltimes s_{i_k} = s_{i_0} \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_k},$$

it is clear that $(b, i_0, i_1, i_2, \cdots, i_{a-1}, i_{a+1}, \cdots, i_k)$ is a reduced I_*-expression for w.

We claim that for any $0 \leq a \leq k$,

$$(b, i_0, i_1, i_2, \cdots, i_{a-1}, i_{a+1}, \cdots, i_k) \longleftrightarrow (i_0, i_1, i_2, \cdots, i_{a-1}, i_a, i_{a+1}, \cdots, i_k), \tag{3.3}$$

whenever

$$s_b \ltimes s_{i_0} \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{a-1}} \ltimes s_{i_{a+1}} \ltimes \cdots \ltimes s_{i_k} = s_{i_0} \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_k}$$

holds. Once this is proved, we can deduce from induction hypothesis that

$$(i_0, i_1, i_2, \cdots, i_{a-1}, i_{a+1}, \cdots, i_k) \longleftrightarrow (j_1, j_2, \cdots, j_k)$$

because $s_{i_0} \ltimes s_{i_1} \ltimes s_{i_2} \ltimes \cdots \ltimes s_{i_{a-1}} \ltimes s_{i_{a+1}} \ltimes \cdots \ltimes s_{i_k} = s_{j_1} \ltimes \cdots \ltimes s_{j_k}$, and hence $(b, i_0, i_1, i_2, \cdots, i_{a-1}, i_{a+1}, \cdots, i_k) \longleftrightarrow (b, j_1, j_2, \cdots, j_k)$. Composing these transformations, we prove (3.2). That is, $(i_0, i_1, i_2, \cdots, i_k) \longleftrightarrow (b, j_1, j_2, \cdots, j_k)$.

The remaining part of the argument is devote to the proof of (3.3). First, we assume that $a > 0$. If $|b - i_0| > 1$, then by Lemma 2.14,

$$s_b \ltimes s_{i_0} \ltimes s_{i_1} \ltimes \cdots \ltimes s_{i_{a-1}} \ltimes s_{i_{a+1}} \ltimes \cdots \ltimes s_{i_k} = s_{i_0} \ltimes s_b \ltimes s_{i_1} \ltimes \cdots \ltimes s_{i_{a-1}} \ltimes s_{i_{a+1}} \ltimes \cdots \ltimes s_{i_k}.$$

By induction hypothesis,

$$(b, i_1, i_2, \cdots, i_{a-1}, i_{a+1}, \cdots, i_k) \longleftrightarrow (i_1, i_2, \cdots, i_{a-1}, i_a, i_{a+1}, \cdots, i_k),$$

and hence

$$\begin{aligned}(b, i_0, i_1, i_2, \cdots, i_{a-1}, i_{a+1}, \cdots, i_k) &\longleftrightarrow (i_0, b, i_1, i_2, \cdots, i_{a-1}, i_{a+1}, \cdots, i_k)\\ &\longleftrightarrow (i_0, i_1, i_2, \cdots, i_{a-1}, i_a, i_{a+1}, \cdots, i_k),\end{aligned}$$

where the second "$\longleftrightarrow$" follows from induction hypothesis. So we are done in this case. Henceforth, we can assume that $|b-i_0|=1$.

Without loss of generality we can assume that $b=i_0+1$. The case when $b=i_0-1$ is exactly the same and is left to the readers. Let $w_1:=s_{i_1}\ltimes s_{i_2}\ltimes\cdots\ltimes s_{i_{a-1}}\ltimes s_{i_{a+1}}\ltimes\cdots\ltimes s_{i_k}$. There are the following four possibilities:

Case 1. $s_{i_0}w_1\neq w_1s_{i_0}$ and $s_b(s_{i_0}w_1s_{i_0})\neq(s_{i_0}w_1s_{i_0})s_b$. In this case, we have that

$$s_{i_0}\ltimes w_1=s_{i_0}w_1s_{i_0},\quad s_b\ltimes s_{i_0}\ltimes w_1=s_bs_{i_0}w_1s_{i_0}s_b.$$

Since $\rho(s_{i_0}\ltimes(s_b\ltimes s_{i_0}\ltimes w_1))=\rho(s_{i_0}\ltimes(s_{i_0}\ltimes s_{i_1}\ltimes\cdots\ltimes s_{i_k}))=k$, it follows that $s_{i_0}(s_b\ltimes s_{i_0}\ltimes w_1)<s_b\ltimes s_{i_0}\ltimes w_1$. Applying Lemma 2.17, we can deduce that $s_bw_1s_{i_0}s_b<w_1s_{i_0}s_b$. Now we are in a position to apply Lemma 2.18 so that we can deduce that $s_bw_1<w_1$. Applying Corollary 2.7, we see that $w_1=s_b\ltimes w_2$ with $w_2\in I_*$ and (s_b,w_2) being reduced. Thus by Lemma 2.14,

$$s_b\ltimes s_{i_0}\ltimes w_1=s_b\ltimes s_{i_0}\ltimes s_b\ltimes w_2=s_{i_0}\ltimes s_b\ltimes s_{i_0}\ltimes w_2.$$

On the other hand, recall that

$$s_{i_0}\ltimes s_{i_1}\ltimes\cdots\ltimes s_k=s_b\ltimes s_{i_0}\ltimes w_1.$$

It follows that

$$s_{i_1}\ltimes s_{i_2}\ltimes\cdots\ltimes s_k=s_b\ltimes s_{i_0}\ltimes w_2.$$

Now using induction hypothesis, we see that $(i_1,i_2,\cdots,i_k)\longleftrightarrow(b,i_0,w_2)$, and hence $(i_0,i_1,i_2,\cdots,i_k)\longleftrightarrow(i_0,b,i_0,w_2)$. Composing this with the transformation $(i_0,b,i_0)\longleftrightarrow(b,i_0,b)$, we can get that

$$(i_0,i_1,i_2,\cdots,i_k)\longleftrightarrow(b,i_0,b,w_2)=(b,i_0,w_1).$$

It follows that

$$(i_0,i_1,i_2,\cdots,i_{a-1},i_a,i_{a+1},\cdots,i_k)\longleftrightarrow(b,i_0,i_1,i_2,\cdots,i_{a-1},i_{a+1},\cdots,i_k)$$

as required.

Case 2. $s_{i_0}w_1\neq w_1s_{i_0}$ and $s_b(s_{i_0}w_1s_{i_0})=(s_{i_0}w_1s_{i_0})s_b$. In this case, we have that

$$s_{i_0}\ltimes w_1=s_{i_0}w_1s_{i_0},\quad s_b\ltimes s_{i_0}\ltimes w_1=s_bs_{i_0}w_1s_{i_0}=s_{i_0}w_1s_{i_0}s_b.$$

Since $\rho(s_{i_0}\ltimes(s_b\ltimes s_{i_0}\ltimes w_1))=\rho(s_{i_0}\ltimes(s_{i_0}\ltimes s_{i_1}\ltimes\cdots\ltimes s_{i_k}))=k$, it follows that $s_{i_0}(s_b\ltimes s_{i_0}\ltimes w_1)<s_b\ltimes s_{i_0}\ltimes w_1$. That is, $s_{i_0}s_bs_{i_0}w_1s_{i_0}<s_bs_{i_0}w_1s_{i_0}$. Applying Lemma 2.17, we can deduce that $s_bw_1s_{i_0}<w_1s_{i_0}$. Once again we are in a position to apply Lemma 2.20 so that we can deduce that $s_bw_1<w_1$. Now one can repeat the same argument used in the proof of Case 1 to complete the remaining proof in this case.

Case 3. $s_{i_0}w_1=w_1s_{i_0}$ and $s_b(s_{i_0}w_1)=(s_{i_0}w_1)s_b$. In this case, we have that

$$s_{i_0}\ltimes w_1=s_{i_0}w_1=w_1s_{i_0},\quad s_b\ltimes s_{i_0}\ltimes w_1=s_bs_{i_0}w_1=w_1s_{i_0}s_b.$$

Since $\rho(s_{i_0}\ltimes(s_b\ltimes s_{i_0}\ltimes w_1))=\rho(s_{i_0}\ltimes(s_{i_0}\ltimes s_{i_1}\ltimes\cdots\ltimes s_{i_k}))=k$, it follows that $s_{i_0}(s_b\ltimes s_{i_0}\ltimes w_1)<s_b\ltimes s_{i_0}\ltimes w_1$. That is, $s_{i_0}s_bs_{i_0}w_1<s_bs_{i_0}w_1$. Applying Lemma 2.17, we can deduce that $s_bw_1<w_1$. Hence $w_1s_b<w_1$ as $w_1=w_1^{-1}$. On the other hand, since (s_b,s_{i_0},w_1) is a reduced sequence, by Lemma 2.5,

$$\ell(s_{i_0}w_1s_b)=\ell(s_b\ltimes s_{i_0}\ltimes w_1)=\ell(w_1)+2,$$

which is a contradiction. Therefore, this case can not happen.

Case 4. $s_{i_0}w_1=w_1s_{i_0}$ and $s_b(s_{i_0}w_1)\neq(s_{i_0}w_1)s_b$. In this case, we have that

$$s_{i_0}\ltimes w_1=s_{i_0}w_1=w_1s_{i_0},\quad s_b\ltimes s_{i_0}\ltimes w_1=s_bs_{i_0}w_1s_b=s_bw_1s_{i_0}s_b.$$

Since $\rho(s_{i_0}\ltimes(s_b\ltimes s_{i_0}\ltimes w_1))=\rho(s_{i_0}\ltimes(s_{i_0}\ltimes s_{i_1}\ltimes\cdots\ltimes s_{i_k}))=k$, it follows that $s_{i_0}(s_b\ltimes s_{i_0}\ltimes w_1)<s_b\ltimes s_{i_0}\ltimes w_1$. That is, $s_{i_0}s_bs_{i_0}w_1s_b<s_bs_{i_0}w_1s_b$. Applying

Lemma 2.17, we can deduce that $s_bw_1s_b < w_1s_b$. Note that (s_b, s_{i_0}, w_1) is a reduced sequence. Applying Lemma 2.5 we know that

$$\ell(s_bs_{i_0}w_1s_b) = \ell(s_bw_1s_{i_0}s_b) = \ell(w_1) + 3.$$

It follows that $w_1s_b > w_1 < s_bw_1$. Now we have that $s_bw_1s_b < w_1s_b > w_1$. Applying Corollary 2.6, we get that $s_bw_1 = w_1s_b$. Since

$$s_{i_0}s_bw_1 = s_{i_0}w_1s_b \neq s_bs_{i_0}w_1 = s_bw_1s_{i_0},$$

it follows that

$$s_b \ltimes s_{i_0} \ltimes w_1 = s_bs_{i_0}w_1s_b = s_bs_{i_0}s_bw_1 = s_{i_0}s_bs_{i_0}w_1 = s_{i_0}s_bw_1s_{i_0} = s_{i_0} \ltimes s_b \ltimes w_1.$$

By induction hypothesis, $(i_0, b, w_1) \longleftrightarrow (i_0, i_1, i_2, \cdots, i_k)$. It remains to show that $(b, i_0, w_1) \longleftrightarrow (i_0, b, w_1)$.

Recall that $i_0 = c = b-1$. Since $s_bw_1s_b < w_1s_b > w_1$ and $w_1 = w_1^{-1}$ imply that $w_1(b) < w_1(b+1)$ and $s_bw_1(b) > s_bw_1(b+1)$, it follows that $w_1(b) = b$, $w_1(b+1) = b+1$. Since $s_{b-1}w_1 = w_1s_{b-1}$, it follows that $s_{b-1}w_1(b-1) = w_1s_{b-1}(b-1) = w_1(b) = b$, and hence $w_1(b-1) = b-1$. There are the following two subcases:

Subcase 1. There exists some $t \leq b-3$ or $t \geq b+2$ such that $s_tw_1 < w_1$. In this case, we obtain that $w_1 = s_t \ltimes w_2$ with $w_2 \in I_*$ and (s_t, w_2) being reduced. It is easy to see that

$$(s_b, s_{b-1}, w_1) \longleftrightarrow (s_b, s_{b-1}, s_t, w_2) \longleftrightarrow (s_b, s_t, s_{b-1}, w_2) \longleftrightarrow (s_t, s_b, s_{b-1}, w_2),$$

$$(s_{b-1}, s_b, w_1) \longleftrightarrow (s_{b-1}, s_b, s_t, w_2) \longleftrightarrow (s_{b-1}, s_t, s_b, w_2) \longleftrightarrow (s_t, s_{b-1}, s_b, w_2).$$

By induction hypothesis, we have that $(s_t, s_b, s_{b-1}, w_2) \longleftrightarrow (s_t, s_{b-1}, s_b, w_2)$ as $\rho(s_b \ltimes s_{b-1} \ltimes w_2) = k$. Therefore, $(s_b, s_{b-1}, w_1) \longleftrightarrow (s_{b-1}, s_b, w_1)$ as required.

Subcase 2. For any $t \leq b-3$ or $t \geq b+2$, we always have that $s_tw_1 > w_1$ and hence $w_1(t) < w_1(t+1)$. In this case, assume that $w_1(b-2) \leq b-2$. Using Lemma 2.21 we can deduce that $w_1(i) = i$ for any $1 \leq i \leq b-2$. Hence $w(b+2) \geq b+2$, which implies that $w_1(j) = j$ for any $b+2 \leq j \leq n$ (by Lemma 2.22 again). Therefore, $w_1 = 1$. Clearly we get $(s_b, s_{b-1}) \longleftrightarrow (s_{b-1}, s_b)$ as required.

Therefore it suffices to consider the situation when $w_1(b-2) > b-2$. By a similar argument as in the last paragraph, we can only consider the situation when $w_1(b+2) < b+2$.

If $b+2 \leq w_1(t) < w_1(t+1)$ for some $t \leq b-3$, then we must have that $w_1(t+1) = w_1(t)+1$ because otherwise $b+2 \leq w_1(t) < z < w_1(t+1)$ implies that $t < w(z) < t+1$, which is impossible.

Now suppose that $w_1(b+2) = b-1-r$, for some $r > 0$. Then the discussion in the last paragraph and the fact that $w_1^2 = 1$ imply that

$$w_1(b-1-r) = b+2, w_1(b-r) = b+3, \cdots, w_1(b-2) = b+1+r,$$
$$w_1(b+2) = b-1-r, w_1(b+3) = b-r, \cdots, w_1(b+1+r) = b-2.$$

In particular, $w_1(b-2-r) \leq b-2-r$, $w_1(b+2-r) \geq b+2-r$. Applying Lemma 2.21 and Lemma 2.22 we see that $w_1(i) = i$ for any $i \leq b-2-r$ or $i \geq b+2+r$. The permutation w_1 can be depicted in Figure 1 as follows:

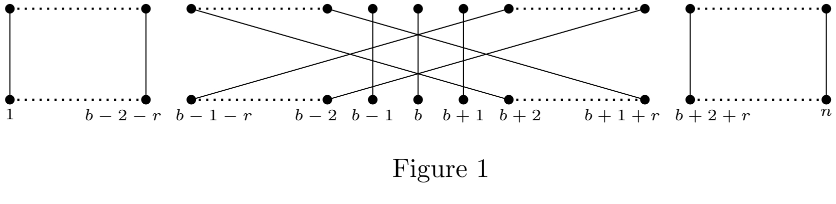

Figure 1

Since $w_1(b-2)=b+1+r>b-1=w_1(b-1)$ implies that $s_{b-2}w_1<w_1$, it follows from Corollary 2.7 that $w_1=s_{b-2}\ltimes w_2$ with $w_2\in I_*$ and (s_{b-2},w_2) being reduced. Since $s_{b-2}w_1(b-1)=s_{b-2}(b-1)=b-2$ and $w_1s_{b-2}(b-1)=w_1(b-2)=b+r+1$, we get that $s_{b-2}w_1\neq w_1s_{b-2}$ and hence $w_2=s_{b-2}\ltimes s_{b-2}\ltimes w_2=s_{b-2}\ltimes w_1=s_{b-2}w_1s_{b-2}$. Furthermore, since $w_2(b-1)=s_{b-2}w_1s_{b-2}(b-1)=b+1+r$ and $w_2(b)=s_{b-2}w_1s_{b-2}(b)=b$, it follows that $s_{b-1}w_2<w_2$ and $w_2=s_{b-1}\ltimes w_3$ with $w_3\in I_*$ and (s_{b-1},w_3) being reduced. Since $s_{b-1}w_2(b)=b-1$ and $w_2s_{b-1}(b)=b+r+1$, we have that $s_{b-1}w_2\neq w_2s_{b-1}$ and hence $w_3=s_{b-1}\ltimes s_{b-1}\ltimes w_3=s_{b-1}\ltimes w_2=s_{b-1}w_2s_{b-1}$.

We proceed further by similar argument. Since $w_3(b)=s_{b-1}s_{b-2}w_1s_{b-2}s_{b-1}(b)=b+1+r$ and $w_3(b+1)=s_{b-1}s_{b-2}w_1s_{b-2}s_{b-1}(b+1)=b+1$, it follows that $s_bw_3<w_3$ and $w_3=s_b\ltimes w_4$ with $w_4\in I_*$ and (s_b,w_4) being reduced. Now we obtain that $w_1=s_{b-2}\ltimes s_{b-1}\ltimes s_b\ltimes w_4$ and $(s_{b-2},s_{b-1},s_b,w_4)$ is reduced. Now by induction hypothesis and Lemma 2.14,

$$\begin{aligned}(s_b,s_{b-1},w_1)&\longleftrightarrow(s_b,s_{b-1},s_{b-2},s_{b-1},s_b,w_4)\longleftrightarrow\\ &(s_b,s_{b-2},s_{b-1},s_{b-2},s_b,w_4)\longleftrightarrow(s_{b-2},s_b,s_{b-1},s_{b-2},s_b,w_4)\end{aligned}$$

and

$$\begin{aligned}(s_{b-1},s_b,w_1)&\longleftrightarrow(s_{b-1},s_b,s_{b-2},s_{b-1},s_b,w_4)\longleftrightarrow(s_{b-1},s_{b-2},s_b,s_{b-1},s_b,w_4)\\ &\longleftrightarrow(s_{b-1},s_{b-2},s_{b-1},s_b,s_{b-1},w_4)\longleftrightarrow(s_{b-2},s_{b-1},s_{b-2},s_b,s_{b-1},w_4).\end{aligned}$$

Once again by induction hypothesis,

$$(s_{b-2},s_b,s_{b-1},s_{b-2},s_b,w_4)\longleftrightarrow(s_{b-2},s_{b-1},s_{b-2},s_b,s_{b-1},w_4),$$

This completes the proof of $(s_{b-1},s_b,w_1)\longleftrightarrow(s_b,s_{b-1},w_1)$. Hence we complete the proof of (3.3) when $a>0$.

It remains to prove (3.3) when $a=0$. In this case, we want to show that

$$(b,i_1,i_2,\cdots,i_k)\longleftrightarrow(c,i_1,i_2,\cdots,i_k).$$

We set $w_1:=s_{i_1}\ltimes s_{i_2}\ltimes\cdots\ltimes s_{i_k}$. Since $s_b\ltimes w_1=s_c\ltimes w_1$ and $s_b\neq s_c$, it follows that $s_b\ltimes w_1=s_bw_1s_b$ and $s_c\ltimes w_1=s_cw_1s_c$, which imply that $w_1s_b>w_1<w_1s_c$ and hence that $w_1(b)<w_1(b+1)$, $w_1(c)<w_1(c+1)$. Since $\rho(s_c\ltimes(s_b\ltimes w_1))=\rho(w_1)=k$, it follows that $s_c(s_b\ltimes w_1)<s_b\ltimes w_1$. That is, $s_cs_bw_1s_b<s_bw_1s_b$, which forces that $s_bw_1s_b(c)>s_bw_1s_b(c+1)$.

We claim that $|b-c|>1$. Suppose this is not case. Without loss of generality we can assume that $c=b+1$. We have proved that $w_1(b)<w_1(b+1)<w_1(b+2)$ and $s_bw_1(b)=s_bw_1s_b(b+1)>s_bw_1s_b(b+2)=s_bw_1(b+2)$. It follows that $w_1(b)=b$, $w_1(b+2)=b+1$, a contradiction. This proves the claim that $|b-c|>1$.

Since $|b-c|>1$, $s_bw_1(c)=s_bw_1s_b(c)>s_bw_1s_b(c+1)=s_bw_1(c+1)$ and $w_1(c)<w_1(c+1)$. Therefore we can deduce that $w_1(c)=b$ and $w_1(c+1)=b+1$. There are two possibilities:

Case 1. $|b-c|=2$. Without loss of generality we can assume that $c=b+2$. In this case, we consider the following two subcases:

Subcase 1. There exists some $t\leq b-2$ or $t\geq b+4$ such that $s_tw_1<w_1$. In this subcase, by Corollary 2.7, we see that $w_1=s_t\ltimes w_2$ with $w_2\in I_*$ and (s_t,w_2) being reduced. By induction hypothesis and Lemma 2.14, we see that

$$\begin{aligned}&(s_b,w_1)\longleftrightarrow(s_b,s_t,w_2)\longleftrightarrow(s_t,s_b,w_2),\\ &(s_{b+2},w_1)\longleftrightarrow(s_{b+2},s_t,w_2)\longleftrightarrow(s_t,s_{b+2},w_2),\\ &(s_t,s_b,w_2)\longleftrightarrow(s_t,s_{b+2},w_2).\end{aligned}$$

It follows that $(s_b,w_1)\longleftrightarrow(s_{b+2},w_1)$ as required.

Subcase 2. For any $t\leq b-2$ or $t\geq b+4$, we always have $s_tw_1>w_1$ and hence $w_1(t)<w_1(t+1)$. In this subcase, we assume first that $w_1(b-1)\leq b-1$. Using

Lemma 2.21 we have that $w_1(i)=i$ for any $1\leq i\leq b-1$. As a result, $w(b+4)\geq b+4$, which (by Lemma 2.22) in turn forces $w_1(j)=j$ for any $b+4\leq j\leq n$. Therefore,

$$w_1=(b,b+2)(b+1,b+3)=s_{b+1}s_bs_{b+2}s_{b+1}=s_{b+1}\ltimes s_b\ltimes s_{b+2}.$$

Consequently, by induction hypothesis and Lemma 2.14, we can deduce that

$$\begin{aligned}(s_b,w_1)&\longleftrightarrow(s_b,s_{b+1},s_b,s_{b+2})\longleftrightarrow(s_{b+1},s_b,s_{b+1},s_{b+2})\longleftrightarrow\\ &(s_{b+1},s_b,s_{b+2},s_{b+1})\longleftrightarrow(s_{b+1},s_{b+2},s_b,s_{b+1})\longleftrightarrow(s_{b+1},s_{b+2},s_{b+1},s_b)\\ &\longleftrightarrow(s_{b+2},s_{b+1},s_{b+2},s_b)\longleftrightarrow(s_{b+2},s_{b+1},s_b,s_{b+2})\longleftrightarrow(s_{b+2},w_1)\end{aligned}$$

as required.

To finish the proof in Subcase 2, we only need to consider the situation when $w_1(b-1)>b-1$. By a similar (and symmetric) argument as in the last paragraph, we can only consider the case when $w_1(b+4)<b+4$.

Recall that $w_1^2=1$ and $w_1(t)\leq w_1(t+1)$ for any $t\leq b-2$. If $w_1(t)\geq b+4$ for some $t\leq b-2$, then $w_1(t+1)=w_1(t)+1$ because otherwise $w_1(t)<q<w_1(t+1)$ implies that $t<w(q)<t+1$ which is impossible. Recall also that $w_1(b)=c=b+2$, $w_1(b+2)=w_1(c)=b$ and $w_1(b)<w_1(b+1)$, $w_1(b+2)<w_1(b+3)$. It follows that $w_1(b-1)\notin\{b,b+1,b+2,b+3\}$. In particular, $w_1(b-1)\geq b+4$. We write $w_1(b-1)=b+3+r$ for some $r>0$. Since $w_1(b-1)=b+3+r>b+2=w_1(b)$ implies that $s_{b-1}w_1<w_1$, it follows that $w_1=s_{b-1}\ltimes w_2$ with $w_2\in I_*$ and (s_{b-1},w_2) being reduced. Now we obtain that

$$(s_b,w_1)\longleftrightarrow(s_b,s_{b-1},w_2)$$

and

$$(s_{b+2},w_1)\longleftrightarrow(s_{b+2},s_{b-1},w_2)\longleftrightarrow(s_{b-1},s_{b+2},w_2).$$

By assumption,

$$s_b\ltimes s_{b-1}\ltimes w_2=s_b\ltimes w_1=s_{b+2}\ltimes w_1=s_{b-1}\ltimes s_{b+2}\ltimes w_2.$$

So we are in a position to apply (3.3) in the case when $a=1$ (which we have already proved). Therefore, we are done in this case.

Case 2. $|b-c|>2$. Without loss of generality we can assume that $c>b+2$. There are two subcases:

Subcase 1. There exists some $t\leq b-2$ or $b+2\leq t\leq c-2$ or $t\geq c+2$ such that $s_tw_1<w_1$. In this case, we obtain that $w_1=s_t\ltimes w_2$ with $w_2\in I_*$ and (s_t,w_2) being reduced. By Lemma 2.14,

$$\begin{aligned}(s_b,w_1)\longleftrightarrow(s_b,s_t,w_2)\longleftrightarrow(s_t,s_b,w_2),\\ (s_c,w_1)\longleftrightarrow(s_c,s_t,w_2)\longleftrightarrow(s_t,s_c,w_2).\end{aligned}$$

Note that $(s_t,s_b,w_2)\longleftrightarrow(s_t,s_c,w_2)$ by induction hypothesis. As a result, we get that $(s_b,w_1)\longleftrightarrow(s_c,w_1)$ as required.

Subcase 2. For any $t\leq b-2$ or $b+2\leq t\leq c-2$ or $t\geq c+2$, we always have that $s_tw_1>w_1$. That is, $w_1(t)<w_1(t+1)$.

Recall that $w_1^2=1$ and we have shown that

$$w_1(b)=c,\ w_1(c)=b,\ w_1(b+1)=c+1,\ w_1(c+1)=b+1.$$

We claim that either $s_{c-1}w_1<w_1$ or $s_{b+1}w_1<w_1$. Suppose this is not the case. That says, $s_{c-1}w_1>w_1$ and $s_{b+1}w_1>w_1$. Then we can deduce that

$$c+1=w_1(b+1)<w_1(b+2)<w_1(b+3)<\cdots<w_1(c-2)<w_1(c-1)<w_1(c)=b,$$

which is a contradiction. This proves our claim.

Suppose that $s_{b+1}w_1<w_1$. Then $w_1=s_{b+1}\ltimes w_2$ with $w_2\in I_*$ and (s_{b+1},w_2) being reduced. Now we obtain that

$$(s_b,w_1)\longleftrightarrow(s_b,s_{b+1},w_2)$$

and

$$(s_c, w_1) \longleftrightarrow (s_c, s_{b+1}, w_2) \longleftrightarrow (s_{b+1}, s_c, w_2).$$

By assumption,

$$s_b \ltimes s_{b+1} \ltimes w_2 = s_b \ltimes w_1 = s_c \ltimes w_1 = s_{b+1} \ltimes s_c \ltimes w_2.$$

So we are in a position to apply (3.3) in the case when $a = 1$ (which we have already proved). Therefore, we are done in this case. By a similar argument, we can reduce the assertion when $s_{c-1}w_1 < w_1$ to a statement of the form (3.3) with $a = 1$ (which we have already proved). Therefore, we complete the proof of the theorem. □

4. The lower bound of the dimension of $\mathcal{H}^{\mathbb{Q}(u)}X_{\emptyset}$ when $* = \mathrm{id}$ and $W = \mathfrak{S}_n$

Recall that $* = \mathrm{id}$ and $W = \mathfrak{S}_n$. In this section we shall prove that the dimension of $\mathcal{H}^{\mathbb{Q}(u)}X_{\emptyset}$ is bigger or equal than the number of involutions in $\mathfrak{S}_n$.

It is well-known that $\mathcal{H}^{\mathbb{Q}(u)}$ is a split semisimple $\mathbb{Q}(u)$-algebra. To recall some well-known results in its representation theory, we need some combinatorics.

A composition of n is a sequence of non-negative integers $\lambda = (\lambda_1, \lambda_2, \cdots, \lambda_r)$ such that $\sum_{i=1}^{r} \lambda_i = n$. The composition $\lambda = (\lambda_1, \lambda_2, \cdots, \lambda_r)$ is called a partition if $\lambda_1 \geq \lambda_2 \geq \cdots \geq \lambda_r$. We use $\mathcal{P}_n$ to denote the set of partitions of n. Let $\lambda \in \mathcal{P}_n$. The Young diagram of λ is the set

$$[\lambda] = \big\{(a, c) \bigm| 1 \leq c \leq \lambda_a, a \geq 1\big\}.$$

A λ-tableau is a bijective map $\mathfrak{t} : [\lambda] \to \{1, 2, \ldots, n\}$. If $\mathfrak{t}$ is a λ-tableau then set $\mathrm{Shape}(\mathfrak{t}) = \boldsymbol{\lambda}$. A λ-tableau $\mathfrak{t}$ is said to be row (column) standard if the numbers $1, 2, \ldots, n$ increase along the rows (columns) of $\mathfrak{t}$, and standard if $\mathfrak{t}$ is both row and column standard. Let $\mathrm{Std}(\lambda)$ be the set of standard λ-tableaux.

Let $\lambda, \mu \in \mathcal{P}_n$. If $\mathfrak{t}$ is a standard λ-tableau, then let $\mathfrak{t}\downarrow_k$ be the subtableau of $\mathfrak{t}$ labeled by $1, \ldots, k$ in $\mathfrak{t}$. If $\mathfrak{s} \in \mathrm{Std}(\lambda)$ and $\mathfrak{t} \in \mathrm{Std}(\mu)$ then $\mathfrak{s}$ dominates $\mathfrak{t}$, and we write $\mathfrak{s} \trianglerighteq \mathfrak{t}$, if $\mathrm{Shape}(\mathfrak{s}\downarrow_k) \trianglerighteq \mathrm{Shape}(\mathfrak{t}\downarrow_k)$, for $k = 1, \ldots, n$. We write $\mathfrak{s} \vartriangleright \mathfrak{t}$ if $\mathfrak{s} \trianglerighteq \mathfrak{t}$ and $\mathfrak{s} \neq \mathfrak{t}$. Let $\mathfrak{t}^{\lambda}$ be the unique standard λ-tableau such that $\mathfrak{t}^{\lambda} \trianglerighteq \mathfrak{t}$ for all $\mathfrak{t} \in \mathrm{Std}(\lambda)$. Then $\mathfrak{t}^{\lambda}$ has the numbers $1, \ldots, n$ entered in order, from left to right and then top to bottom along the rows of λ. Let $\mathfrak{t}_{\lambda}$ be the unique standard λ-tableau such that $\mathfrak{t}^{\lambda} \trianglelefteq \mathfrak{t}$ for all $\mathfrak{t} \in \mathrm{Std}(\lambda)$. Then $\mathfrak{t}_{\lambda}$ has the numbers $1, \ldots, n$ entered in order, from top to bottom and then left to right along the columns of λ. If $\lambda = (\lambda_1, \lambda_2, \ldots)$ is a partition then its conjugate is the partition

$$\lambda' = (\lambda'_1, \lambda'_2, \ldots),$$

where $\lambda'_i = \#\{j \geq 1 | \lambda_j \geq i\}$. If $\mathfrak{t}$ is a standard λ-tableau let $\mathfrak{t}'$ be the standard λ'-tableau given by $\mathfrak{t}'(r, c) = \mathfrak{t}(c, r)$.

It is well-known that $\mathcal{H}^{\mathbb{Q}(u)}$ is a split semisimple algebra over $\mathbb{Q}(u)$. Following [**11**, 2.4], let $\{f_{\mathfrak{s}\mathfrak{t}} | \mathfrak{s}, \mathfrak{t} \in \mathrm{Std}(\lambda), \lambda \in \mathcal{P}_n\}$ be the seminormal basis of $\mathcal{H}^{\mathbb{Q}(u)}$. By definition, for any $\lambda \in \mathcal{P}_n$, $\mathfrak{s}, \mathfrak{t}, \mathfrak{u}, \mathfrak{v} \in \mathrm{Std}(\lambda)$, we have that

$$f_{\mathfrak{s}\mathfrak{t}} f_{\mathfrak{u}\mathfrak{v}} = \delta_{\mathfrak{t}\mathfrak{u}} \gamma_{\mathfrak{t}} f_{\mathfrak{s}\mathfrak{v}},$$

where $\gamma_{\mathfrak{t}} \in \mathbb{Q}(u)^{\times}$ is a nonzero scalar (which can be written down explicitly). Furthermore, $\mathcal{H}^{\mathbb{Q}(u)} f_{\mathfrak{s}\mathfrak{t}} \cong \mathcal{H}^{\mathbb{Q}(u)} f_{\mathfrak{s}\mathfrak{t}^{\lambda}}$ is a simple left $\mathcal{H}^{\mathbb{Q}(u)}$-module. We denote this module by $V^{\lambda}_{\mathbb{Q}(u)}$. Then $\{V^{\lambda}_{\mathbb{Q}(u)} | \lambda \in \mathcal{P}_n\}$ is a complete set of pairwise non-isomorphic simple left $\mathcal{H}^{\mathbb{Q}(u)}$-modules.

For any subset $J \subseteq \{1, 2, \cdots, n\}$, we use $\mathfrak{S}_J$ to denote the standard Young subgroup of $\mathfrak{S}_n$ generated by $\{s_i | i, i+1 \in J\}$. Let $\lambda \in \mathcal{P}_n$. The symmetric group

$\mathfrak{S}_n$ acts on the set of λ-tableaux from the left hand-side. If $\mathfrak{t}$ is a λ-tableau with $\lambda \in \mathcal{P}_n$, and $w \in \mathfrak{S}_n$, we also define

$$\mathfrak{t}w := w^{-1}\mathfrak{t}.$$

Let λ be a composition of n. Let $\mathfrak{S}_\lambda$ be the row stabilizer of $\mathfrak{t}^\lambda$, which is the standard Young subgroup of $\mathfrak{S}_n$ corresponding to

$$I_\lambda := \{1, 2, \cdots, \lambda_1\} \sqcup \{\lambda_1 + 1, \lambda_1 + 2, \cdots, \lambda_1 + \lambda_2\} \sqcup \cdots .$$

Let $\mathcal{H}_u(\mathfrak{S}_\lambda)$ be the subalgebra of $\mathcal{H}_u$ generated by $\{T_i | s_i \in \mathfrak{S}_\lambda\}$. If $\mathfrak{t} \in \operatorname{Std}(\lambda)$ let $d(\mathfrak{t})$ be the permutation in $\mathfrak{S}_n$ such that $\mathfrak{t} = \mathfrak{t}^\lambda d(\mathfrak{t})$. Let

$$\mathcal{D}_\lambda := \{d \in \mathfrak{S}_n | \mathfrak{t}^\lambda d \text{ is row standard}\}.$$

Then $\mathcal{D}_\lambda$ is the set of minimal length distinguished right coset representatives of $\mathfrak{S}_\lambda$ in $\mathfrak{S}_n$. For any $\lambda, \mu \in \mathcal{P}_n$, we set $\mathcal{D}_{\lambda,\mu} := \mathcal{D}_\lambda \cap \mathcal{D}_\mu^{-1}$. Then $\mathcal{D}_{\lambda,\mu}$ is the set of minimal length distinguished double coset representatives of $(\mathfrak{S}_\lambda, \mathfrak{S}_\mu)$ in $\mathfrak{S}_n$. Let $w_\lambda \in \mathfrak{S}_n$ such that $\mathfrak{t}^\lambda w_\lambda = \mathfrak{t}_\lambda$. Then $w_\lambda \in \mathcal{D}_{\lambda,\lambda'}$.

4.1. **Lemma.** *Let $\lambda \in \mathcal{P}_n$. Then $f_{\mathfrak{t}\mathfrak{t}^\lambda} X_\emptyset f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} \neq 0$ for any $\mathfrak{t} \in \operatorname{Std}(\lambda)$. In particular, we have that*

$$\dim_{\mathbb{Q}(u)} \mathcal{H}^{\mathbb{Q}(u)} X_\emptyset \geq \sum_{\lambda \in \mathcal{P}_n} \# \operatorname{Std}(\lambda).$$

Proof. It suffices to show that $f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} X_\emptyset f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} \neq 0$ because $f_{\mathfrak{t}\mathfrak{t}^\lambda} f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} = \gamma_{\mathfrak{t}^\lambda} f_{\mathfrak{t}\mathfrak{t}^\lambda}$ for some $\gamma_{\mathfrak{t}^\lambda} \in \mathbb{Q}(u)^\times$.

By [**2**, Lemma 1.1], for any $w \in \mathfrak{S}_n$, there exists a unique element $d \in \mathfrak{S}_\lambda w \mathfrak{S}_\mu$ such that

$$d \in \mathcal{D}_{\lambda,\mu},\ w = w_1 d w_2,\ w_1 \in \mathfrak{S}_\lambda, w_2 \in \mathcal{D}_{\lambda d \cap \mu} \cap \mathfrak{S}_\mu,\ \ell(w) = \ell(w_1) + \ell(d) + \ell(w_2),$$

where $\lambda d \cap \mu$ is the composition of n corresponding to standard Young subgroup $d^{-1}\mathfrak{S}_\lambda d \cap \mathfrak{S}_\mu$ of $\mathfrak{S}_n$. In particular,

$$u^{-\ell(w)} T_w = (u^{-\ell(w_1)} T_{w_1})(u^{-\ell(d)} T_d)(u^{-\ell(w_2)} T_{w_2}).$$

If $w_1 \in \mathfrak{S}_\lambda$, then $f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_{w_1} = u^{2\ell(w_1)} f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda}$ by [**11**, Proposition 2.7]. If $w_2 \in \mathfrak{S}_{\lambda'}$, then $T_{w_2} f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} = (-1)^{\ell(w_2)} f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda}$ by [**11**, Proposition 2.7] again.

By the above discussion, we have that

$$\begin{aligned} X_\emptyset &= \sum_{d \in \mathcal{D}_{\lambda,\lambda'}} \sum_{w \in \mathfrak{S}_\lambda d (\mathcal{D}_{\lambda d \cap \lambda'} \cap \mathfrak{S}_{\lambda'})} u^{-\ell(w)} T_w \\ &= \sum_{d \in \mathcal{D}_{\lambda,\lambda'}} u^{-\ell(d)} \Big(\sum_{w_1 \in \mathfrak{S}_\lambda} u^{-\ell(w_1)} T_{w_1} \Big) T_d \Big(\sum_{w_2 \in \mathcal{D}_{\lambda d \cap \lambda'} \cap \mathfrak{S}_{\lambda'}} u^{-\ell(w_2)} T_{w_2} \Big) \end{aligned}$$

It follows that

$$\begin{aligned} & f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} X_\emptyset f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} \\ &= \big(\sum_{w_1 \in \mathfrak{S}_\lambda} u^{\ell(w_1)} \big) \sum_{d \in \mathcal{D}_{\lambda,\lambda'}} \Big(\sum_{w_2 \in \mathcal{D}_{\lambda d \cap \lambda'} \cap \mathfrak{S}_{\lambda'}} (-u)^{-\ell(w_2)} u^{-\ell(d)} \Big) f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_d f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} \end{aligned}$$

Let $d \in \mathcal{D}_{\lambda,\lambda'}$. We claim that if $d^{-1}\mathfrak{S}_\lambda d \cap \mathfrak{S}_{\lambda'} \neq \{1\}$, then $f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_d f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} = 0$. In fact, assume that $1 \neq z \in d^{-1}\mathfrak{S}_\lambda d \cap \mathfrak{S}_{\lambda'} \neq \{1\}$. We write $z = d^{-1} z_1 d$, where $z_1 \in \mathfrak{S}_\lambda$. Therefore, we get that

$$\begin{aligned} u^{2\ell(z_1)} f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_d f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} &= f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_{z_1} T_d f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} = f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_{z_1 d} f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} = f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_{dz} f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} \\ &= (-1)^{\ell(z)} f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_d f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda}, \end{aligned}$$

and hence $(u^{2\ell(z_1)} - (-1)^{\ell(z)}) f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_d f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda}=0$. Since $z \neq 1$ and hence $z_1 \neq 1$, it follows that $u^{2\ell(z_1)} - (-1)^{\ell(z)} \neq 0$, and hence $f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda} T_d f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda}=0$ as required. This proves our claim.

As a result, we can deduce that

$$\begin{aligned} & f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda}X_\emptyset f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} \\ &= \Big(\sum_{w_1\in\mathfrak{S}_\lambda} u^{\ell(w_1)}\Big) \sum_{\substack{d\in\mathcal{D}_{\lambda,\lambda'} \\ d^{-1}\mathfrak{S}_\lambda d\cap\mathfrak{S}_{\lambda'}=\{1\}}} \Big(\sum_{w_2\in\mathcal{D}_{\lambda d\cap\lambda'}\cap\mathfrak{S}_{\lambda'}} (-u)^{-\ell(w_2)}\Big) u^{-\ell(d)} f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda}T_d f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda}\end{aligned}$$

On the other hand, it is well-known that $\mathfrak{S}_\lambda w_\lambda\mathfrak{S}_{\lambda'}$ is the unique double coset in $\mathfrak{S}_\lambda\backslash\mathfrak{S}_n/\mathfrak{S}_{\lambda'}$ which has the trivial intersection property (see [**2**, Proof of Lemma 4.1]), i.e., $w_\lambda^{-1}\mathfrak{S}_\lambda w_\lambda\cap\mathfrak{S}_{\lambda'}=\{1\}$. In particular, $\mathcal{D}_{\lambda w_\lambda,\lambda'}=\mathfrak{S}_n$, and hence

$$f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda}X_\emptyset f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} = \Big(\sum_{w_1\in\mathfrak{S}_\lambda} u^{\ell(w_1)}\Big)\Big(\sum_{w_2\in\mathfrak{S}_{\lambda'}} (-u)^{-\ell(w_2)}\Big)u^{-\ell(w_\lambda)} f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda}T_{w_\lambda} f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda}.$$

By[**11**, Proposition 2.7]and[**2**, Lemma 1.5], we can deduce that

$$f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda}T_{w_\lambda} = f_{\mathfrak{t}^\lambda\mathfrak{t}_\lambda} + \sum_{w_\lambda>z,\mathfrak{t}^\lambda z\in\operatorname{Std}(\lambda)} a_z f_{\mathfrak{t}^\lambda,\mathfrak{t}^\lambda z},$$

where $a_z\in\mathbb{Q}(u^2)$ for each z. In particular,

$$f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda}T_{w_\lambda} f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda} = \gamma_{\mathfrak{t}^\lambda} f_{\mathfrak{t}^\lambda\mathfrak{t}_\lambda}\neq 0.$$

Note also that both $\sum_{w_1\in\mathfrak{S}_\lambda} u^{\ell(w_1)}$ and $\sum_{w_2\in\mathfrak{S}_{\lambda'}}(-u)^{-\ell(w_2)}$ are nonzero because they have leading terms equal to $u^{\ell(w_{\lambda,0})}$ and $(-u)^{-\ell(w_{\lambda',0})}$, where $w_{\lambda,0}$ and $w_{\lambda',0}$ are the unique longest elements in $\mathfrak{S}_\lambda$ and $\mathfrak{S}_{\lambda'}$ respectively. It follows that

$$f_{\mathfrak{t}^\lambda\mathfrak{t}^\lambda}X_\emptyset f_{\mathfrak{t}_\lambda\mathfrak{t}_\lambda}\neq 0,$$

as required. This completes the proof of the lemma. □

4.2. **Corollary.** *We have that*

$$\sum_{\lambda\in\mathcal{P}_n}\#\operatorname{Std}(\lambda) = \#\{w\in\mathfrak{S}_n|w^2=1\}.$$

In particular,

$$\dim_{\mathbb{Q}(u)}\mathcal{H}^{\mathbb{Q}(u)}X_\emptyset\geq\#\{w\in\mathfrak{S}_n|w^2=1\}.$$

Proof. Let

$$\begin{aligned}\pi:\mathfrak{S}_n &\to \{(\mathfrak{s},\mathfrak{t})|\mathfrak{s},\mathfrak{t}\in\operatorname{Std}(\lambda),\lambda\in\mathcal{P}_n\} \\ w &\mapsto (P(w),Q(w))\end{aligned}$$

be the Robinson-Schensted correspondence, cf.[**1**]. By definition, π is a bijection onto the set $\{(\mathfrak{s},\mathfrak{t})|\mathfrak{s},\mathfrak{t}\in\operatorname{Std}(\lambda),\lambda\in\mathcal{P}_n\}$, $Q(w)=P(w^{-1})$ for each $w\in\mathfrak{S}_n$. It follows that π induces a bijection between the set I_* of the involutions in $\mathfrak{S}_n$ and the set $\sqcup_{\lambda\in\mathcal{P}_n}\operatorname{Std}(\lambda)$. In particular, $\sum_{\lambda\in\mathcal{P}_n}\#\operatorname{Std}(\lambda)=\#\{w\in\mathfrak{S}_n|w^2=1\}$, as required. This proves the first part of the corollary. The second part of the corollary follows from Lemma 4.1. □

5. PROOF OF LUSZTIG'S CONJECTURE 1.4 WHEN $*=\mathrm{ID}$ AND $W=\mathfrak{S}_n$

In this section, we shall give the main result of this paper. That is, a proof of Lusztig's Conjecture 1.4 when $*=\mathrm{id}$ and $W=\mathfrak{S}_n$. Recall that $\{a_w|w^2=1,w\in\mathfrak{S}_n\}$ is an $\mathcal{A}$-basis of M.

5.1. **Lemma.** *The map $a_1 \mapsto X_\emptyset$ can be extended to a well-defined $\mathbb{Q}(u)$-linear map η_0 from $\mathbb{Q}(u) \otimes_{\mathcal{A}} M$ to $\mathcal{H}^{\mathbb{Q}(u)} X_\emptyset$ such that for any $w \in I_*$ and any reduced I_*-expression $\sigma = (s_{j_1}, \cdots, s_{j_k})$ for w,*

$$\eta_0(a_w) = \theta_\sigma(X_\emptyset) := \theta_{\sigma,1} \circ \theta_{\sigma,2} \circ \cdots \circ \theta_{\sigma,k}(X_\emptyset),$$

where for each $1 \le t \le k$, if

$$s_{j_t}(s_{j_{t+1}} \ltimes s_{j_{t+2}} \ltimes \cdots \ltimes s_{j_k}) \neq (s_{j_{t+1}} \ltimes s_{j_{t+2}} \ltimes \cdots \ltimes s_{j_k}) s_{j_t} > (s_{j_{t+1}} \ltimes s_{j_{t+2}} \ltimes \cdots \ltimes s_{j_k}),$$

then we define $\theta_{\sigma,t} := T_{s_{j_t}}$; while if

$$s_{j_t}(s_{j_{t+1}} \ltimes s_{j_{t+2}} \ltimes \cdots \ltimes s_{j_k}) = (s_{j_{t+1}} \ltimes s_{j_{t+2}} \ltimes \cdots \ltimes s_{j_k}) s_{j_t} > (s_{j_{t+1}} \ltimes s_{j_{t+2}} \ltimes \cdots \ltimes s_{j_k}),$$

then we define $\theta_{\sigma,t} := (T_{s_{j_t}} - u)/(u+1)$.

Proof. It suffices to show that the operator $\theta_\sigma := \theta_{\sigma,1} \circ \theta_{\sigma,2} \circ \cdots \circ \theta_{\sigma,k}$ depends only on w and not on the choice of the reduced I_*-expression $\sigma = (s_{j_1}, \cdots, s_{j_k})$ for any given $w \in I_*$.

By Theorem 3.1, it suffices to show that θ_σ does not change under any one of the three basic braid I_*-transformations as introduced in Definition 2.12. So there are three possibilities:

Case 1. $|j_t - j_{t+1}| > 1$ for some $1 \le t < k$, and the braid I_*-transformation sends

$$\sigma = (s_{j_1}, \cdots, s_{j_{t-1}}, s_{j_t}, s_{j_{t+1}}, s_{j_{t+2}}, \cdots, s_{j_k})$$

to $\tau := (s_{j_1}, \cdots, s_{j_{t-1}}, s_{j_{t+1}}, s_{j_t}, s_{j_{t+2}}, \cdots, s_{j_k})$. In this case, it follows from Corollary 2.16 and the fact that $T_{j_t} T_{j_{t+1}} = T_{j_{t+1}} T_{j_t}$ that

$$\theta_{\sigma,t} \circ \theta_{\sigma,t+1} \circ \cdots \circ \theta_{\sigma,k}(X_\emptyset) = \theta_{\tau,t} \circ \theta_{\tau,t+1} \circ \cdots \circ \theta_{\tau,k}(X_\emptyset).$$

Hence $\theta_\sigma(X_\emptyset) = \theta_\tau(X_\emptyset)$ as required.

Case 2. $j_{t-2} = j_t = j_{t-1} \pm 1$ for some $3 \le t \le k$, and the braid I_*-transformation sends

$$\sigma = (s_{j_1}, \cdots, s_{j_{t-3}}, s_{j_{t-2}}, s_{j_{t-1}}, s_{j_t}, s_{j_{t+1}}, s_{j_{t+2}}, \cdots, s_{j_k})$$

to $\tau := (s_{j_1}, \cdots, s_{j_{t-3}}, s_{j_{t-1}}, s_{j_t}, s_{j_{t-1}}, s_{j_{t+1}}, s_{j_{t+2}}, \cdots, s_{j_k})$.

Note that $t \neq k$ because otherwise $j_{k-2} = j_k = j_{k-1} \pm 1$ would imply that $s_{j_{k-2}} \ltimes s_{j_{k-1}} \ltimes s_{j_k}$ is not a reduced I_*-expression, a contradiction. Therefore, we must have that $3 \le t \le k-1$. In this case, we set

$$w := s_{j_{t+1}} \ltimes s_{j_{t+2}} \ltimes \cdots \ltimes s_{j_k}.$$
$$Z_0 := \theta_{\sigma,t+1} \circ \theta_{\sigma,t+2} \circ \cdots \circ \theta_{\sigma,k}(X_\emptyset).$$

Then by Corollary 2.15, there are three subcases:

Subcase 1. $s_{j_t} w \neq w s_{j_t}$, $s_{j_{t-1}} s_{j_t} w s_{j_t} \neq s_{j_t} w s_{j_t} s_{j_{t-1}}$,

$$s_{j_t} s_{j_{t-1}} s_{j_t} w s_{j_t} s_{j_{t-1}} \neq s_{j_{t-1}} s_{j_t} w s_{j_t} s_{j_{t-1}} s_{j_t},$$

and $s_{j_{t-1}} w \neq w s_{j_{t-1}}$, $s_{j_t} s_{j_{t-1}} w s_{j_{t-1}} \neq s_{j_{t-1}} w s_{j_{t-1}} s_{j_t}$,

$$s_{j_{t-1}} s_{j_t} s_{j_{t-1}} w s_{j_{t-1}} s_{j_t} \neq s_{i_t} s_{j_{t-1}} w s_{i_{t-1}} s_{j_t} s_{j_{t-1}}.$$

It follows from Lemma 2.14 and Corollary 2.15 that

$$\begin{aligned} &\theta_{\sigma,t-2} \circ \theta_{\sigma,t-1} \circ \theta_{\sigma,t} \circ \theta_{\sigma,t+1} \circ \theta_{\sigma,t+2} \circ \cdots \circ \theta_{\sigma,k}(X_\emptyset) \\ &= T_{j_t} T_{j_{t-1}} T_{j_t} Z_0 = T_{j_{t-1}} T_{j_t} T_{j_{t-1}} Z_0 \\ &= \theta_{\tau,t-2} \circ \theta_{\tau,t-1} \circ \theta_{\tau,t} \circ \theta_{\tau,t+1} \circ \theta_{\tau,t+2} \circ \cdots \circ \theta_{\tau,k}(X_\emptyset). \end{aligned}$$

Hence $\theta_\sigma(X_\emptyset) = \theta_\tau(X_\emptyset)$ as required.

Subcase 2. $s_{j_t} w \neq w s_{j_t}$, $s_{j_{t-1}} s_{j_t} w s_{j_t} \neq s_{j_t} w s_{j_t} s_{j_{t-1}}$,

$$s_{j_t} s_{j_{t-1}} s_{j_t} w s_{j_t} s_{j_{t-1}} = s_{j_{t-1}} s_{j_t} w s_{j_t} s_{j_{t-1}} s_{j_t},$$

and $s_{j_{t-1}}w = ws_{j_{t-1}}$, $s_{j_t}s_{j_{t-1}}w \neq s_{j_{t-1}}ws_{j_t}$,

$$s_{j_{t-1}}s_{j_t}s_{j_{t-1}}ws_{j_t} \neq s_{j_t}s_{j_{t-1}}ws_{j_t}s_{j_{t-1}}.$$

It follows from Lemma 2.14 and Corollary 2.15 that

$$\begin{aligned}&\theta_{\sigma,t-2}\circ\theta_{\sigma,t-1}\circ\theta_{\sigma,t}\circ\theta_{\sigma,t+1}\circ\theta_{\sigma,t+2}\circ\cdots\circ\theta_{\sigma,k}(X_{\emptyset})\\ &=\frac{T_{j_t}-u}{u+1}T_{j_{t-1}}T_{j_t}Z_0 = T_{j_{t-1}}T_{j_t}\frac{T_{j_{t-1}}-u}{u+1}Z_0\\ &=\theta_{\tau,t-2}\circ\theta_{\tau,t-1}\circ\theta_{\tau,t}\circ\theta_{\tau,t+1}\circ\theta_{\tau,t+2}\circ\cdots\circ\theta_{\tau,k}(X_{\emptyset}).\end{aligned}$$

Hence $\theta_\sigma(X_\emptyset) = \theta_\tau(X_\emptyset)$ as required.

Subcase 3. $s_{j_t}w = ws_{j_t}$, $s_{j_{t-1}}s_{j_t}w \neq s_{j_t}ws_{j_{t-1}}$,

$$s_{j_t}s_{j_{t-1}}s_{j_t}ws_{j_{t-1}} \neq s_{j_{t-1}}s_{j_t}ws_{j_{t-1}}s_{j_t},$$

and $s_{j_{t-1}}w \neq ws_{j_{t-1}}$, $s_{j_t}s_{j_{t-1}}ws_{j_{t-1}} \neq s_{j_{t-1}}ws_{j_{t-1}}s_{j_t}$,

$$s_{j_{t-1}}s_{j_t}s_{j_{t-1}}ws_{j_{t-1}}s_{j_t} = s_{j_t}s_{j_{t-1}}ws_{j_{t-1}}s_{j_t}s_{j_{t-1}}.$$

It follows from Lemma 2.14 and Corollary 2.15 that

$$\begin{aligned}&\theta_{\sigma,t-2}\circ\theta_{\sigma,t-1}\circ\theta_{\sigma,t}\circ\theta_{\sigma,t+1}\circ\theta_{\sigma,t+2}\circ\cdots\circ\theta_{\sigma,k}(X_{\emptyset})\\ &=T_{j_t}T_{j_{t-1}}\frac{T_{j_t}-u}{u+1}Z_0 = \frac{T_{j_{t-1}}-u}{u+1}T_{j_t}T_{j_{t-1}}Z_0\\ &=\theta_{\tau,t-2}\circ\theta_{\tau,t-1}\circ\theta_{\tau,t}\circ\theta_{\tau,t+1}\circ\theta_{\tau,t+2}\circ\cdots\circ\theta_{\tau,k}(X_{\emptyset}).\end{aligned}$$

Hence $\theta_\sigma(X_\emptyset) = \theta_\tau(X_\emptyset)$ as required.

Case 3. $|j_{k-1}-j_k| = 1$, and the braid I_*-transformation sends

$$\sigma = (s_{j_1},\cdots,s_{j_{k-3}},s_{j_{k-2}},s_{j_{k-1}},s_{j_k})$$

to $\tau := (s_{j_1},\cdots,s_{j_{k-3}},s_{j_{k-2}},s_{j_k},s_{j_{k-1}})$. Without loss of generality, we can assume that $j_{k-1} = j_k+1$. For simplicity, we set $a := j_k$, then $j_{k-1} = a+1$.

Let $\mathcal{D}(a)$ be the set of minimal length distinguished right coset representatives of $\mathfrak{S}_{\{a,a+1\}}$ in $\mathfrak{S}_n$. Then it is clear that

$$X_\emptyset = \Big(\sum_{w\in\mathfrak{S}_{\{a,a+1\}}} u^{-\ell(w)}T_w\Big)\Big(\sum_{z\in\mathcal{D}(a)} u^{-\ell(z)}T_z\Big). \tag{5.2}$$

In this case, all we want to do is to show that

$$T_{s_a}\frac{T_{s_{a+1}}-u}{u+1}X_\emptyset = T_{s_{a+1}}\frac{T_{s_a}-u}{u+1}X_\emptyset.$$

By (5.2), it suffices to show that

$$T_{s_a}\frac{T_{s_{a+1}}-u}{u+1}\sum_{w\in\mathfrak{S}_{\{a,a+1\}}}u^{-\ell(w)}T_w = T_{s_{a+1}}\frac{T_{s_a}-u}{u+1}\sum_{w\in\mathfrak{S}_{\{a,a+1\}}}u^{-\ell(w)}T_w.$$

By direct verification, we can get that

$$\begin{aligned}T_{s_a}\frac{T_{s_{a+1}}-u}{u+1}&\sum_{w\in\mathfrak{S}_{\{a,a+1\}}}u^{-\ell(w)}T_w = T_{s_a}\frac{T_{s_{a+1}}-u}{u+1}\Big(1+u^{-1}T_{s_a}+u^{-1}T_{s_{a+1}}\\ &+u^{-2}T_{s_a}T_{s_{a+1}}+u^{-2}T_{s_{a+1}}T_{s_a}+u^{-3}T_{s_a}T_{s_{a+1}}T_{s_a}\Big)\\ =&\,(u-u^{-1})(T_{s_a}T_{s_{a+1}}+T_{s_{a+1}}T_{s_a})+(1+u+u^{-3}-u^{-2}-2u^{-1})T_{s_a}T_{s_{a+1}}T_{s_a}\\ =&\,T_{s_{a+1}}\frac{T_{s_a}-u}{u+1}\Big(1+u^{-1}T_{s_a}+u^{-1}T_{s_{a+1}}+u^{-2}T_{s_a}T_{s_{a+1}}+u^{-2}T_{s_{a+1}}T_{s_a}+u^{-3}T_{s_a}T_{s_{a+1}}T_{s_a}\Big)\\ =&\,T_{s_{a+1}}\frac{T_{s_a}-u}{u+1}\sum_{w\in\mathfrak{S}_{\{a,a+1\}}}u^{-\ell(w)}T_w,\end{aligned}$$

as required. This completes the proof of the lemma. □

5.3. **Lemma.** *With the notations as in Lemma 5.1, the* $\mathbb{Q}(u)$*-linear map* η_0 *is a left* $\mathcal{H}^{\mathbb{Q}(u)}$*-module homomorphism. In particular,* $\eta_0=\eta$ *is a well-defined surjective left* $\mathcal{H}^{\mathbb{Q}(u)}$*-homomorphism from* $\mathbb{Q}(u)\otimes_{\mathcal{A}}M$ *onto* $\mathcal{H}^{\mathbb{Q}(u)}X_{\emptyset}$.

Proof. Once we can prove that η_0 is a left $\mathcal{H}^{\mathbb{Q}(u)}$-module homomorphism, then it follows immediately that η is well-defined and $\eta_0=\eta$ because both of them send a_1 to $X_\emptyset$.

Since $\{a_w|w\in I_*\}$ is an $\mathcal{A}$-basis of M (and hence a $\mathbb{Q}(u)$-basis of $\mathbb{Q}(u)\otimes_{\mathcal{A}}M$), in order to show that η_0 is a left $\mathcal{H}^{\mathbb{Q}(u)}$-module homomorphism, it suffices to show that for any $w\in I_*$ and any $1\leq k<n$,

$$\eta_0(T_{s_k}a_w)=T_{s_k}\eta_0(a_w). \tag{5.4}$$

We use induction on $\rho(w)$ to prove (5.4). If $\rho(w)=0$ then $w=1$. In this case, by the definition of η_0 in Lemma 5.1,

$$\eta_0(T_{s_k}a_w)=\eta_0(T_{s_k}a_1)=\eta_0(a_{s_k})=T_{s_k}X_\emptyset=T_{s_k}\eta_0(a_1),$$

as required. In general, let $m\in\mathbb{N}$. Suppose that for any $1\leq k<n$ and any $w'\in I_*$ with $\rho(w')<m$, we have that

$$\eta_0(T_{s_k}a_{w'})=T_{s_k}\eta_0(a_{w'}).$$

Now let $w\in I_*$ with $\rho(w)=m$. There are two possibilities:

Case 1. $s_kw>w$. If $s_kw\neq ws_k$, then by the definition of η_0 in Lemma 5.1,

$$\eta_0(T_{s_k}a_w)=\eta_0(a_{s_k\ltimes w})=T_{s_k}\eta_0(a_w),$$

as required. If $s_kw=ws_k$, then by the definition of η_0 in Lemma 5.1,

$$\eta_0(\frac{T_{s_k}-u}{u+1}a_w)=\eta_0(a_{s_k\ltimes w})=\frac{T_{s_k}-u}{u+1}\eta_0(a_w).$$

It follows that $\eta_0(T_{s_k}a_w)=T_{s_k}\eta_0(a_w)$ still holds in this case.

Case 2. $s_kw<w$. By Corollary 2.7, we can write $w=s_k\ltimes w'$ with $\rho(w)=\rho(w')+1$. In particular, $\rho(w')=\rho(w)-1=m-1<m$. If $s_kw'\neq w's_k$, then by induction hypothesis and Theorem 1.2, we have that

$$\eta_0(a_w)=\eta_0(T_{s_k}a_{w'})=T_{s_k}\eta_0(a_{w'}).$$

It follows from induction hypothesis and Lemma 5.1 that

$$\begin{aligned}\eta_0(T_{s_k}a_w)&=\eta_0((T_{s_k})^2a_{w'})=\eta_0\big((u^2-1)T_{s_k}a_{w'}+u^2a_{w'}\big)\\&=(u^2-1)\eta_0(T_{s_k}a_{w'})+u^2\eta_0(a_{w'})=(u^2-1)T_{s_k}\eta_0(a_{w'})+u^2\eta_0(a_{w'})\\&=T_{s_k}T_{s_k}\eta_0(a_{w'})=T_{s_k}\eta_0(T_{s_k}a_{w'})=T_{s_k}\eta_0(a_w),\end{aligned}$$

as required.

If $s_kw'=w's_k$, then

$$\eta_0(a_w)=\eta_0(\frac{T_{s_k}-u}{u+1}a_{w'})=\frac{T_{s_k}-u}{u+1}\eta_0(a_{w'}).$$

It follows from induction hypothesis and Lemma 5.1 that

$$\begin{aligned}\eta_0(T_{s_k}a_w)&=\eta_0(T_{s_k}\frac{T_{s_k}-u}{u+1}a_{w'})=\eta_0\big(\frac{(u^2-u-1)T_{s_k}}{u+1}a_{w'}+\frac{u^2}{u+1}a_{w'}\big)\\&=\frac{(u^2-u-1)}{u+1}\eta_0(T_{s_k}a_{w'})+\frac{u^2}{u+1}\eta_0(a_{w'})\\&=\frac{(u^2-u-1)}{u+1}T_{s_k}\eta_0(a_{w'})+\frac{u^2}{u+1}\eta_0(a_{w'})\\&=T_{s_k}\frac{T_{s_k}-u}{u+1}\eta_0(a_{w'})=T_{s_k}\eta_0(\frac{T_{s_k}-u}{u+1}a_{w'})=T_{s_k}\eta_0(a_w),\end{aligned}$$

as required. □

5.5. **Theorem.** *Lusztig's conjecture (1.4) is true in the case when* $* = id$ *and* $W = \mathfrak{S}_n$.

Proof. By Lemma 5.3, η defines a surjective left $\mathcal{H}^{\mathbb{Q}(u)}$-module homomorphism from $\mathbb{Q}(u) \otimes_{\mathcal{A}} M$ onto $\mathcal{H}^{\mathbb{Q}(u)} X_{\emptyset}$. On the other hand, by Lemma 5.1,

$$\dim_{\mathbb{Q}(u)} \mathcal{H}^{\mathbb{Q}(u)} X_{\emptyset} \geq \#\{w \in \mathfrak{S}_n | w^2 = 1\} = \dim_{\mathbb{Q}(u)} \mathbb{Q}(u) \otimes_{\mathcal{A}} M.$$

It follows that η must be a left $\mathcal{H}^{\mathbb{Q}(u)}$-module isomorphism. □
